What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

2.7 Oscillator Value Conditions on Device Start-up

2: Refer to Table 15-1 for $\overline{\text{FLTB1}}$ implementation details.

3: The PxFLTACON register is a write-protected register. Refer to **Section 15.3 “Write-Protected Registers”** for more information on the unlock sequence.

16.1 SPI Helpful Tips

1. In Frame mode, if there is a possibility that the master may not be initialized before the slave:
   a) If FRMPOL (SPIxCON2<13>) = 1, use a pull-down resistor on $\overline{SS}$x.
   b) If FRMPOL = 0, use a pull-up resistor on $\overline{SS}$x.

Note:	This insures that the first frame transmission after initialization is not shifted or corrupted.

2. In Non-Framed 3-Wire mode (i.e., not using $\overline{SS}$x from a master):
   a) If CKP (SPIxCON1<6>) = 1, always place a pull-up resistor on $\overline{SS}$x.
   b) If CKP = 0, always place a pull-down resistor on $\overline{SS}$x.

Note:	This will insure that during power-up and initialization, the master/slave will not lose sync due to an errant SCK transition that would cause the slave to accumulate data shift errors for both transmit and receive, appearing as corrupted data.

3. FRMEN (SPIxCON2<15>) = 1 and SSEN (SPIxCON1<7>) = 1 are exclusive and invalid. In Frame mode, SCKx is continuous and the Frame Sync pulse is active on the $\overline{SS}$x pin, which indicates the start of a data frame.

Note:	Not all third-party devices support Frame mode timing. Refer to the SPI electrical characteristics for details.

4. In Master mode only, set the SMP bit (SPIxCON1<9>) to a '1' for the fastest SPI data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1<5>) is set.
5. To avoid invalid slave read data to the master, the user's master software must ensure enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to pre-load the SPIxBUF Transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPIx Shift register and is empty once the data transmission begins.
6. The SPI related pins (SDI1, SDO1, SCK1) are located at fixed positions in the dsPIC33FJ16(GP/MC)10X devices. The same pins are remappable in the dsPIC33FJ32(GP/MC)10X devices.
