Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	MPC8xx
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	80MHz
Co-Processors/DSP	Communications; CPM
RAM Controllers	DRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10Mbps (2)
SATA	-
USB	-
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 95°C (TA)
Security Features	-
Package / Case	357-BBGA
Supplier Device Package	357-PBGA (25x25)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc860dezq80d4

1 Overview

The MPC860 power quad integrated communications controller (PowerQUICC™) is a versatile one-chip integrated microprocessor and peripheral combination designed for a variety of controller applications. It particularly excels in communications and networking systems. The PowerQUICC unit is referred to as the MPC860 in this hardware specification.

The MPC860 implements Power Architecture™ technology and contains a superset of Freescale's MC68360 quad integrated communications controller (QUICC), referred to here as the QUICC, RISC communications proccessor module (CPM). The CPU on the MPC860 is a 32-bit core built on Power Architecture technology that incorporates memory management units (MMUs) and instruction and data caches.. The CPM from the MC68360 QUICC has been enhanced by the addition of the inter-integrated controller (I^2C) channel. The memory controller has been enhanced, enabling the MPC860 to support any type of memory, including high-performance memories and new types of DRAMs. A PCMCIA socket controller supports up to two sockets. A real-time clock has also been integrated.

Table 1 shows the functionality supported by the MPC860 family.

Table 1. MPC860 Family Functionality

Part	Cache (Kbytes)		Ethernet		ATM	SCC	Reference[1]
	Instruction Cache	Data Cache	10T	10/100			
MPC860DE	4	4	Up to 2	—	—	2	1
MPC860DT	4	4	Up to 2	1	Yes	2	1
MPC860DP	16	8	Up to 2	1	Yes	2	1
MPC860EN	4	4	Up to 4	—	—	4	1
MPC860SR	4	4	Up to 4	—	Yes	4	1
MPC860T	4	4	Up to 4	1	Yes	4	1
MPC860P	16	8	Up to 4	1	Yes	4	1
MPC855T	4	4	1	1	Yes	1	2

[1] Supporting documentation for these devices refers to the following:
1. MPC860 PowerQUICC Family User's Manual (MPC860UM, Rev. 3)
2. MPC855T User's Manual (MPC855TUM, Rev. 1)

2 Features

The following list summarizes the key MPC860 features:

- Embedded single-issue, 32-bit core (implementing the Power Architecture technology) with thirty-two 32-bit general-purpose registers (GPRs)
  - The core performs branch prediction with conditional prefetch without conditional execution.
  - 4- or 8-Kbyte data cache and 4- or 16-Kbyte instruction cache (see Table 1)
    - 16-Kbyte instruction caches are four-way, set-associative with 256 sets; 4-Kbyte instruction caches are two-way, set-associative with 128 sets.
    - 8-Kbyte data caches are two-way, set-associative with 256 sets; 4-Kbyte data caches are two-way, set-associative with 128 sets.
    - Cache coherency for both instruction and data caches is maintained on 128-bit (4-word) cache blocks.
    - Caches are physically addressed, implement a least recently used (LRU) replacement algorithm, and are lockable on a cache block basis.
  - MMUs with 32-entry TLB, fully-associative instruction, and data TLBs
  - MMUs support multiple page sizes of 4-, 16-, and 512-Kbytes, and 8-Mbytes; 16 virtual address spaces and 16 protection groups
  - Advanced on-chip-emulation debug mode
- Up to 32-bit data bus (dynamic bus sizing for 8, 16, and 32 bits)
- 32 address lines
- Operates at up to 80 MHz
- Memory controller (eight banks)
  - Contains complete dynamic RAM (DRAM) controller
  - Each bank can be a chip select or $\overline{\text{RAS}}$ to support a DRAM bank.
  - Up to 15 wait states programmable per memory bank
  - Glueless interface to DRAM, SIMMS, SRAM, EPROM, Flash EPROM, and other memory devices
  - DRAM controller programmable to support most size and speed memory interfaces
  - Four $\overline{\text{CAS}}$ lines, four $\overline{\text{WE}}$ lines, and one $\overline{\text{OE}}$ line
  - Boot chip-select available at reset (options for 8-, 16-, or 32-bit memory)
  - Variable block sizes (32 Kbytes to 256 Mbytes)
  - Selectable write protection
  - On-chip bus arbitration logic
- General-purpose timers
  - Four 16-bit timers or two 32-bit timers
  - Gate mode can enable/disable counting
  - Interrupt can be masked on reference match and event capture.

  - Up to 8 Kbytes of dual-port RAM
  - 16 serial DMA (SDMA) channels
  - Three parallel I/O registers with open-drain capability
- Four baud-rate generators (BRGs)
  - Independent (can be tied to any SCC or SMC)
  - Allows changes during operation
  - Autobaud support option
- Four serial communications controllers (SCCs)
  - Ethernet/IEEE 802.3® standard optional on SCC1–4, supporting full 10-Mbps operation (available only on specially programmed devices)
  - HDLC/SDLC (all channels supported at 2 Mbps)
  - HDLC bus (implements an HDLC-based local area network (LAN))
  - Asynchronous HDLC to support point-to-point protocol (PPP)
  - AppleTalk
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Serial infrared (IrDA)
  - Binary synchronous communication (BISYNC)
  - Totally transparent (bit streams)
  - Totally transparent (frame-based with optional cyclic redundancy check (CRC))
- Two SMCs (serial management channels)
  - UART
  - Transparent
  - General circuit interface (GCI) controller
  - Can be connected to the time-division multiplexed (TDM) channels
- One SPI (serial peripheral interface)
  - Supports master and slave modes
  - Supports multimaster operation on the same bus
- One I^2C (inter-integrated circuit) port
  - Supports master and slave modes
  - Multiple-master environment support
- Time-slot assigner (TSA)
  - Allows SCCs and SMCs to run in multiplexed and/or non-multiplexed operation
  - Supports T1, CEPT, PCM highway, ISDN basic rate, ISDN primary rate, user defined
  - 1- or 8-bit resolution
  - Allows independent transmit and receive routing, frame synchronization, and clocking

3 Maximum Tolerated Ratings

This section provides the maximum tolerated voltage and temperature ranges for the MPC860. Table 2 provides the maximum ratings.

This device contains circuitry protecting against damage due to high-static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{DD}).

Table 2. Maximum Tolerated Ratings

(GND = 0 V)

Rating	Symbol	Value	Unit
Supply voltage[1]	V_{DDH}	–0.3 to 4.0	V
	V_{DDL}	–0.3 to 4.0	V
	KAPWR	–0.3 to 4.0	V
	V_{DDSYN}	–0.3 to 4.0	V
Input voltage[2]	V_{in}	GND – 0.3 to V_{DDH}	V
Temperature[3] (standard)	$T_{A(min)}$	0	°C
	$T_{j(max)}$	95	°C
Temperature[3] (extended)	$T_{A(min)}$	–40	°C
	$T_{j(max)}$	95	°C
Storage temperature range	T_{stg}	–55 to 150	°C

1 The power supply of the device must start its ramp from 0.0 V.

2 Functional operating conditions are provided with the DC electrical specifications in Table 6. Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.
Caution: All inputs that tolerate 5 V cannot be more than 2.5 V greater than the supply voltage. This restriction applies to power-up and normal operation (that is, if the MPC860 is unpowered, voltage greater than 2.5 V must not be applied to its inputs).

3 Minimum temperatures are guaranteed as ambient temperature, T_A. Maximum temperatures are guaranteed as junction temperature, T_j.

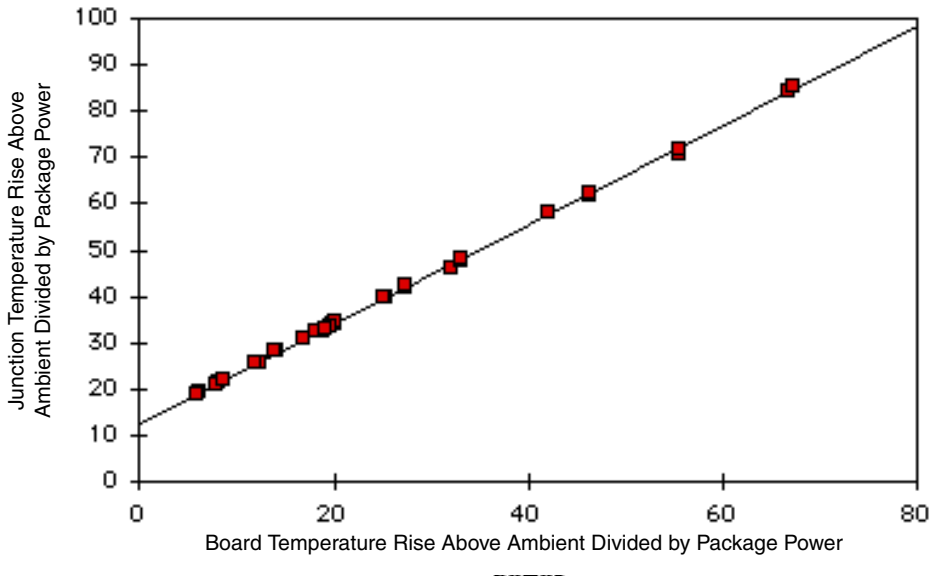

Figure 2. Effect of Board Temperature Rise on Thermal Behavior

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (ºC/W)

T_B = board temperature (ºC)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

7.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application [2], or a more accurate and complex model of the package can be used in the thermal simulation.

7.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

Table 7. Bus Operation Timings (continued)

Num	Characteristic	33 MHz		40 MHz		50 MHz		66 MHz		Unit
		Min	Max	Min	Max	Min	Max	Min	Max	
B29d	$\overline{WE}$(0:3) negated to D(0:31), DP(0:3) High-Z GPCM write access, TRLX = 1, CSNT = 1, EBDF = 0	43.45	—	35.5	—	28.00	—	20.73	—	ns

B43	$\overline{AS}$ negation to memory controller signals negation	—	TBD	—	TBD	—	TBD	—	TBD	ns

1 Phase and frequency jitter performance results are only valid if the input jitter is less than the prescribed value.

2 If the rate of change of the frequency of EXTAL is slow (that is, it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (that is, it does not stay at an extreme value for a long time) then the maximum allowed jitter on EXTAL can be up to 2%.

3 The timings specified in B4 and B5 are based on full strength clock.

4 The timing for $\overline{BR}$ output is relevant when the MPC860 is selected to work with external bus arbiter. The timing for $\overline{BG}$ output is relevant when the MPC860 is selected to work with internal bus arbiter.

5 The timing required for $\overline{BR}$ input is relevant when the MPC860 is selected to work with internal bus arbiter. The timing for $\overline{BG}$ input is relevant when the MPC860 is selected to work with external bus arbiter.

6 The D(0:31) and DP(0:3) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the $\overline{TA}$ input signal is asserted.

7 The D(0:31) and DP(0:3) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the UPM in the memory controller, for data beats where DLT3 = 1 in the UPM RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

8 The timing B30 refers to $\overline{CS}$ when ACS = 00 and to $\overline{WE}$(0:3) when CSNT = 0.

9 The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in Figure 18.

10 The $\overline{AS}$ signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in Figure 21.

Figure 7 provides the timing for the synchronous input signals.

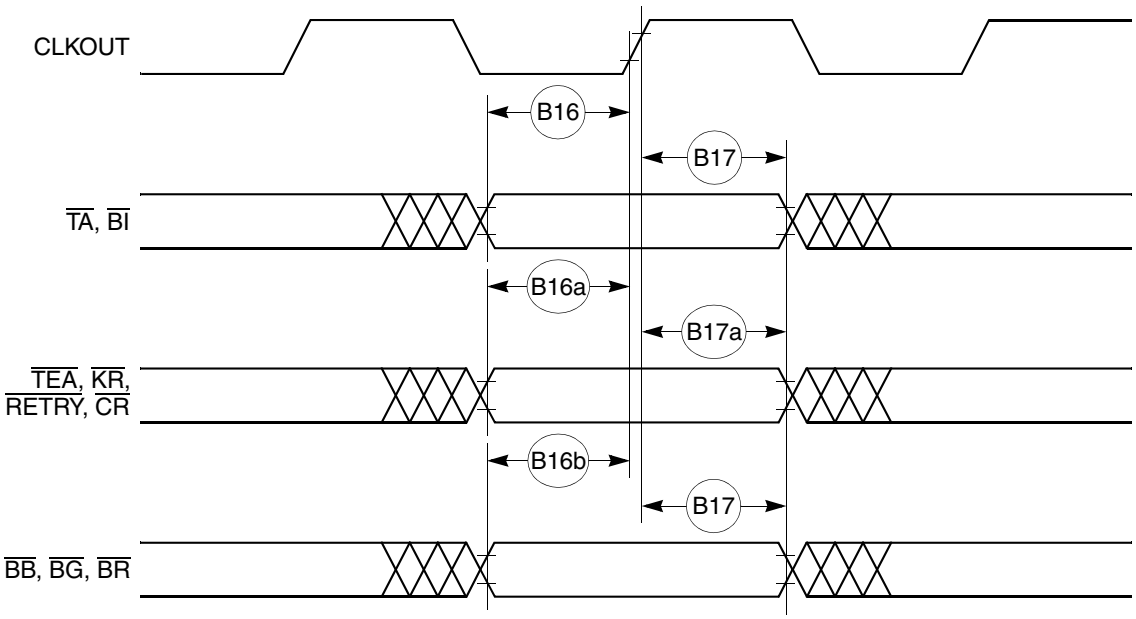

Figure 7. Synchronous Input Signals Timing

Figure 8 provides normal case timing for input data. It also applies to normal read accesses under the control of the UPM in the memory controller.

11.5 Timer AC Electrical Specifications

Table 18 provides the general-purpose timer timings as shown in Figure 50.

Table 18. Timer Timing

Num	Characteristic	All Frequencies		Unit
		Min	Max	
61	TIN/$\overline{\text{TGATE}}$ rise and fall time	10	—	ns
62	TIN/$\overline{\text{TGATE}}$ low time	1	—	CLK
63	TIN/$\overline{\text{TGATE}}$ high time	2	—	CLK
64	TIN/$\overline{\text{TGATE}}$ cycle time	3	—	CLK
65	CLKO low to $\overline{\text{TOUT}}$ valid	3	25	ns

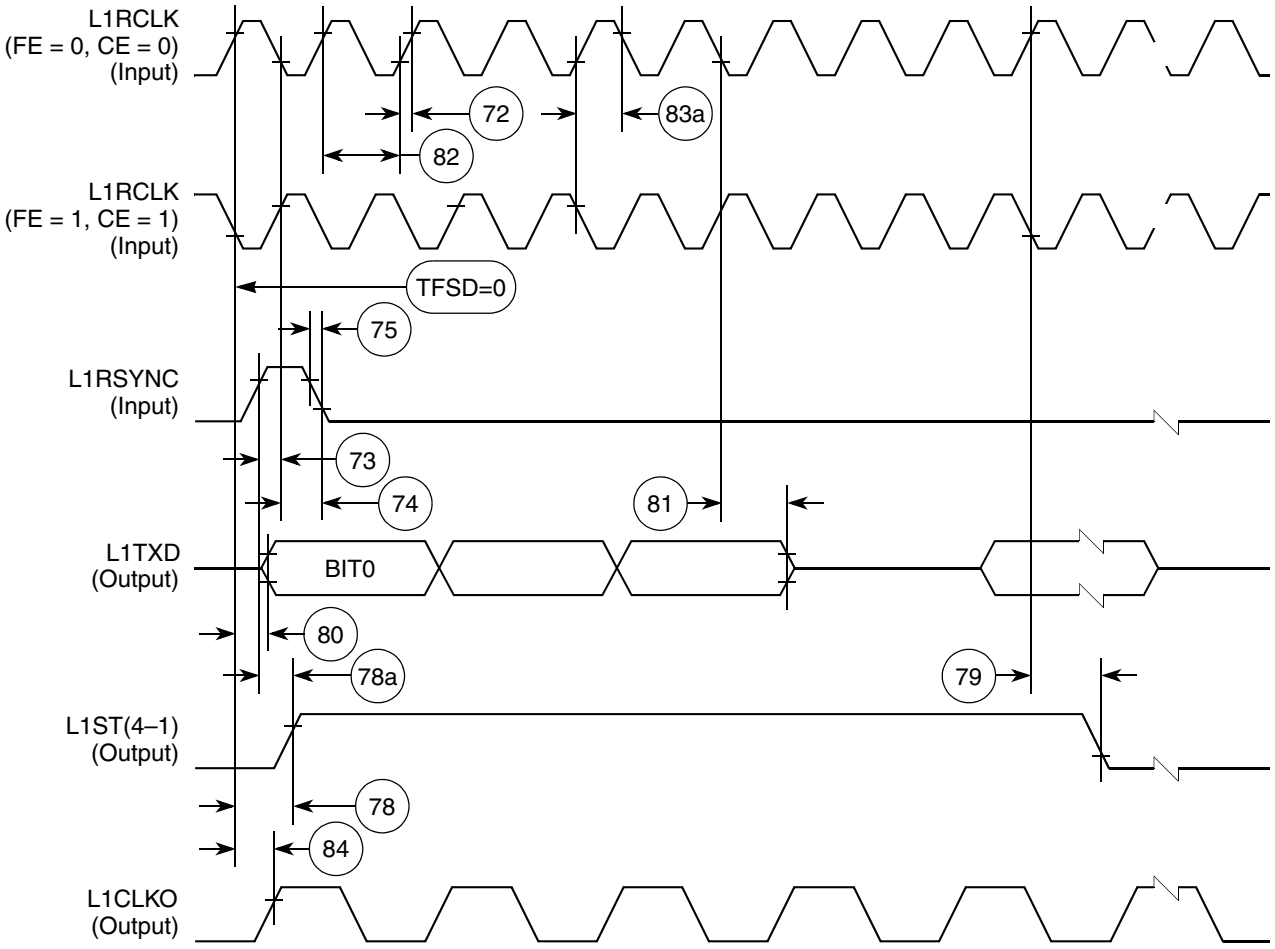

Figure 54. SI Transmit Timing with Double Speed Clocking (DSC = 1)

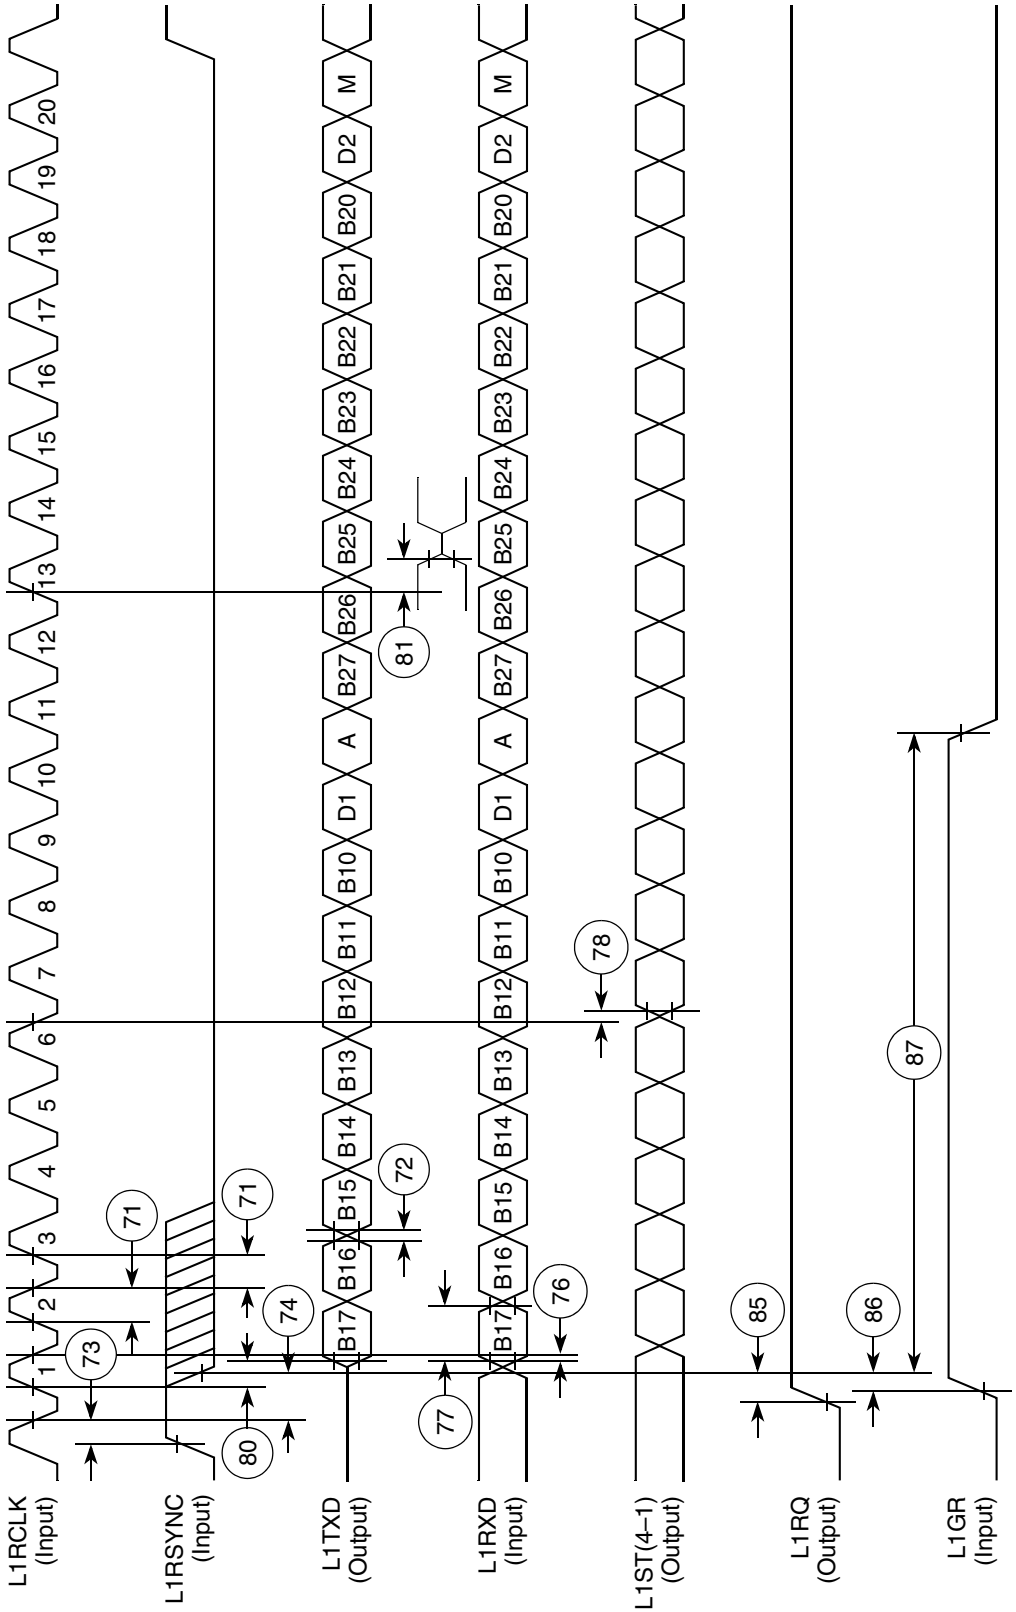

Figure 55. IDL Timing

11.12 I²C AC Electrical Specifications

Table 26 provides the I²C (SCL < 100 kHz) timings.

Table 26. I²C Timing (SCL < 100 kHz)

Num	Characteristic	All Frequencies		Unit
		Min	Max	
200	SCL clock frequency (slave)	0	100	kHz
200	SCL clock frequency (master)[1]	1.5	100	kHz
202	Bus free time between transmissions	4.7	—	µs
203	Low period of SCL	4.7	—	µs
204	High period of SCL	4.0	—	µs
205	Start condition setup time	4.7	—	µs
206	Start condition hold time	4.0	—	µs
207	Data hold time	0	—	µs
208	Data setup time	250	—	ns
209	SDL/SCL rise time	—	1	µs
210	SDL/SCL fall time	—	300	ns
211	Stop condition setup time	4.7	—	µs

1 SCL frequency is given by SCL = BRGCLK_frequency / ((BRG register + 3 × pre_scaler × 2).
The ratio SYNCCLK/(BRGCLK/pre_scaler) must be greater than or equal to 4/1.

Table 27 provides the I²C (SCL > 100 kHz) timings.

Table 27. . I²C Timing (SCL > 100 kHz)

Num	Characteristic	Expression	All Frequencies		Unit
			Min	Max	
200	SCL clock frequency (slave)	fSCL	0	BRGCLK/48	Hz
200	SCL clock frequency (master)[1]	fSCL	BRGCLK/16512	BRGCLK/48	Hz
202	Bus free time between transmissions		1/(2.2 * fSCL)	—	s
203	Low period of SCL		1/(2.2 * fSCL)	—	s
204	High period of SCL		1/(2.2 * fSCL)	—	s
205	Start condition setup time		1/(2.2 * fSCL)	—	s
206	Start condition hold time		1/(2.2 * fSCL)	—	s
207	Data hold time		0	—	s
208	Data setup time		1/(40 * fSCL)	—	s
209	SDL/SCL rise time		—	1/(10 * fSCL)	s
210	SDL/SCL fall time		—	1/(33 * fSCL)	s
211	Stop condition setup time		1/2(2.2 * fSCL)	—	s

1 SCL frequency is given by SCL = BRGCLK_frequency / ((BRG register + 3) × pre_scaler × 2).
The ratio SYNCCLK/(BRGCLK / pre_scaler) must be greater than or equal to 4/1.

15 Document Revision History

Table 35 lists significant changes between revisions of this hardware specification.

Table 35. Document Revision History

Revision	Date	Changes
10	09/2015	In Table 34, moved MPC855TCVR50D4 and MPC855TCVR66D4 under the extended temperature (–40° to 95°C) and removed MC860ENCVR50D4R2 from the normal temperature Tape and Reel.
9	10/2011	Updated orderable part numbers in Table 34, “MPC860 Family Package/Frequency Availability.”
8	08/2007	• Updated template. • On page 1, added a second paragraph. • After Table 2, inserted a new figure showing the undershoot/overshoot voltage (Figure 1) and renumbered the rest of the figures. • In Figure 3, changed all reference voltage measurement points from 0.2 and 0.8 V to 50% level. • In Table 16, changed num 46 description to read, “$\overline{TA}$ assertion to rising edge ...” • In Figure 46, changed $\overline{TA}$ to reflect the rising edge of the clock.
7.0	9/2004	• Added a tablefootnote to Table 6 DC Electrical Specifications about meeting the VIL Max of the I2C Standard • Replaced the thermal characteristics in Table 4 by the ZQ package • Add the new parts to the Ordering and Availablity Chart in Table 34 • Added the mechanical spec of the ZQ package in Figure 78 • Removed all of the old revisions from Table 5
6.3	9/2003	• Added Section 11.2 on the Port C interrupt pins • Nontechnical reformatting
6.2	8/2003	• Changed B28a through B28d and B29d to show that TRLX can be 0 or 1 • Changed reference documentation to reflect the Rev 2 MPC860 PowerQUICC Family Users Manual • Nontechnical reformatting
6.1	11/2002	• Corrected UTOPIA RXenb* and TXenb* timing values • Changed incorrect usage of Vcc to Vdd • Corrected dual port RAM to 8 Kbytes
6	10/2002	• Added the MPC855T. Corrected Figure 26 on page -36.
5.1	11/2001	• Revised template format, removed references to MAC functionality, changed Table 7 B23 max value @ 66 MHz from 2ns to 8ns, added this revision history table
