
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300c2
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	333MHz
Co-Processors/DSP	Communications; QUICC Engine
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (3)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	516-BBGA
Supplier Device Package	516-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8321czqafdc

1 Overview

The MPC8323E incorporates the e300c2 (MPC603e-based) core built on Power Architecture® technology, which includes 16 Kbytes of L1 instruction and data caches, dual integer units, and on-chip memory management units (MMUs). The e300c2 core does not contain a floating point unit (FPU). The MPC8323E also includes a 32-bit PCI controller, four DMA channels, a security engine, and a 32-bit DDR1/DDR2 memory controller.

A new communications complex based on QUICC Engine technology forms the heart of the networking capability of the MPC8323E. The QUICC Engine block contains several peripheral controllers and a 32-bit RISC controller. Protocol support is provided by the main workhorses of the device—the unified communication controllers (UCCs). Note that the MPC8321 and MPC8321E do not support UTOPIA. A block diagram of the MPC8323E is shown in Figure 1.

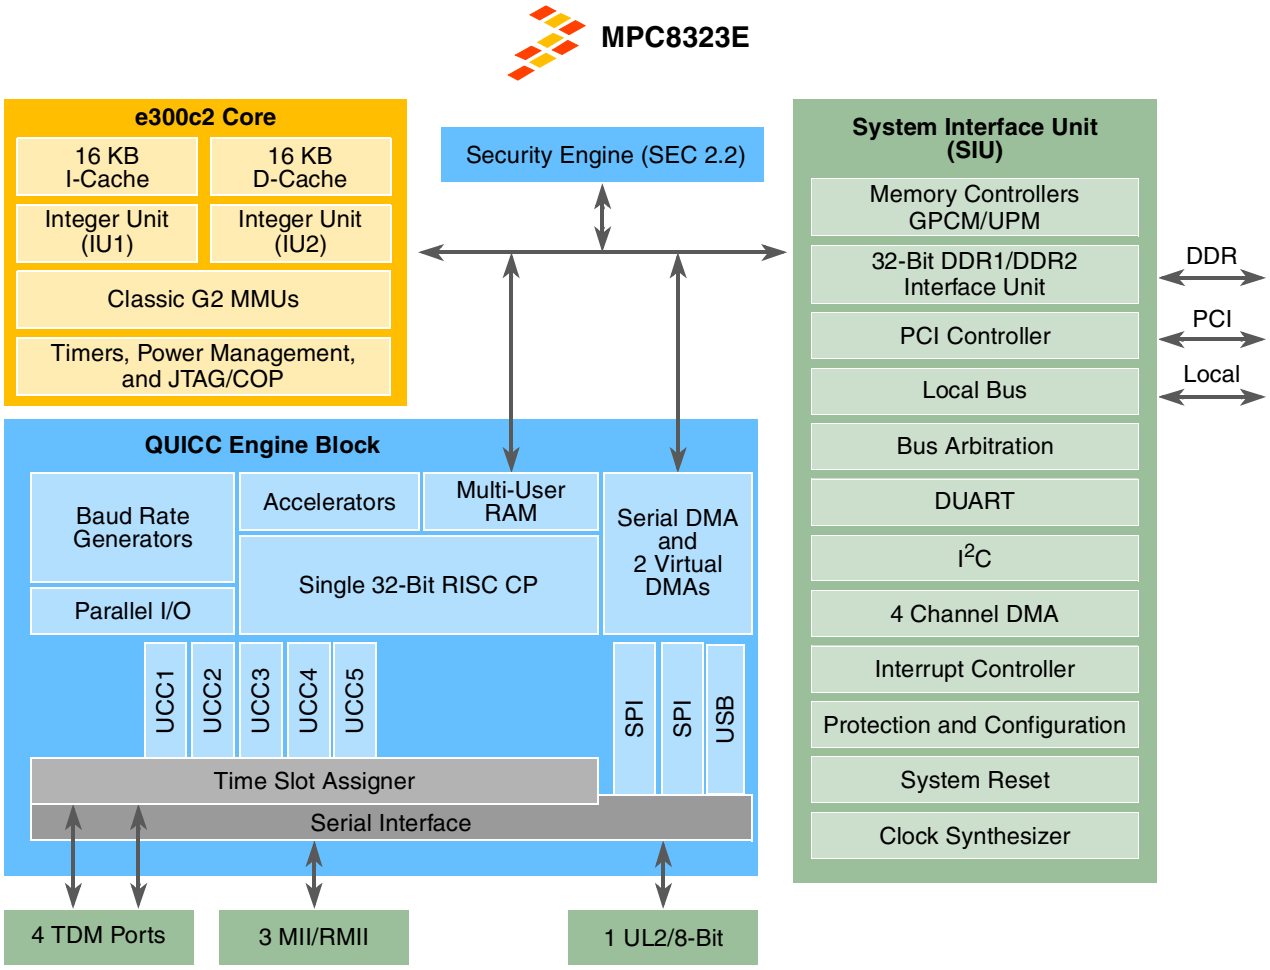

Figure 1. MPC8323E Block Diagram

Each of the five UCCs can support a variety of communication protocols: 10/100 Mbps Ethernet, serial ATM, HDLC, UART, and BISYNC—and, in the MPC8323E and MPC8323, multi-PHY ATM and ATM support for up to OC-3 speeds.

1.1.2 Serial Interfaces

The MPC8323E serial interfaces are as follows:

- Support for one UL2 interface with 31 multi-PHY addresses (MPC8323E and MPC8323 only)
- Support for up to three 10/100 Mbps Ethernet interfaces using MII or RMII
- Support for up to four T1/E1/J1/E3 or DS-3 serial interfaces (TDM)
- Support for dual UART and SPI interfaces and a single I^2C interface

1.2 QUICC Engine Block

The QUICC Engine block is a versatile communications complex that integrates several communications peripheral controllers. It provides on-chip system design for a variety of applications, particularly in communications and networking systems. The QUICC Engine block has the following features:

- One 32-bit RISC controller for flexible support of the communications peripherals
- Serial DMA channel for receive and transmit on all serial channels
- Five universal communication controllers (UCCs) supporting the following protocols and interfaces (not all of them simultaneously):
  - 10/100 Mbps Ethernet/IEEE 802.3® standard
  - IP support for IPv4 and IPv6 packets including TOS, TTL, and header checksum processing
  - ATM protocol through UTOPIA interface (note that the MPC8321 and MPC8321E do not support the UTOPIA interface)
  - HDLC /transparent up to 70-Mbps full-duplex
  - HDLC bus up to 10 Mbps
  - Asynchronous HDLC
  - UART
  - BISYNC up to 2 Mbps
  - QUICC multi-channel controller (QMC) for 64 TDM channels
- One UTOPIA interface (UPC1) supporting 31 multi-PHYs (MPC8323E- and MPC8323-specific)
- Two serial peripheral interfaces (SPI). SPI2 is dedicated to Ethernet PHY management.
- Four TDM interfaces
- Thirteen independent baud rate generators and 19 input clock pins for supplying clocks to UCC serial channels
- Four independent 16-bit timers that can be interconnected as two 32-bit timers

The UCCs are similar to the PowerQUICC II peripherals: SCC (BISYNC, UART, and HDLC bus) and FCC (fast Ethernet, HDLC, transparent, and ATM).

1.3 Security Engine

The security engine is optimized to handle all the algorithms associated with IPSec, IEEE 802.11i™ standard, and iSCSI. The security engine contains one crypto-channel, a controller, and a set of crypto execution units (EUs). The execution units are:

- Data encryption standard execution unit (DEU), supporting DES and 3DES
- Advanced encryption standard unit (AESU), supporting AES
- Message digest execution unit (MDEU), supporting MD5, SHA1, SHA-256, and HMAC with any algorithm
- One crypto-channel supporting multi-command descriptor chains

1.4 DDR Memory Controller

The MPC8323E DDR1/DDR2 memory controller includes the following features:

- Single 32-bit interface supporting both DDR1 and DDR2 SDRAM
- Support for up to 266-MHz data rate
- Support for two ×16 devices
- Support for up to 16 simultaneous open pages
- Supports auto refresh
- On-the-fly power management using CKE
- 1.8-/2.5-V SSTL2 compatible I/O
- Support for 1 chip select only
- FCRAM, ECC, hardware/software calibration, bit deskew, QIN stage, or atomic logic are not supported.

1.5 PCI Controller

The MPC8323E PCI controller includes the following features:

- *PCI Specification Revision 2.3* compatible
- Single 32-bit data PCI interface operates up to 66 MHz
- PCI 3.3-V compatible (not 5-V compatible)
- Support for host and agent modes
- On-chip arbitration, supporting three external masters on PCI
- Selectable hardware-enforced coherency

1.6 Programmable Interrupt Controller (PIC)

The programmable interrupt controller (PIC) implements the necessary functions to provide a flexible solution for general-purpose interrupt control. The PIC programming model is compatible with the MPC8260 interrupt controller, and it supports 8 external and 35 internal discrete interrupt sources. Interrupts can also be redirected to an external interrupt controller.

2.1.2 Power Supply Voltage Specification

Table 2 provides the recommended operating conditions for the MPC8323E. Note that these values are the recommended and tested operating conditions. Proper device operation outside of these conditions is not guaranteed.

Table 2. Recommended Operating Conditions[3]

Characteristic	Symbol	Recommended Value	Unit	Notes
Core supply voltage	V_{DD}	1.0 V ± 50 mV	V	1
PLL supply voltage	AV_{DD}	1.0 V ± 50 mV	V	1
DDR1 and DDR2 DRAM I/O voltage	GV_{DD}	2.5 V ± 125 mV 1.8 V ± 90 mV	V	1
PCI, local bus, DUART, system control and power management, I^2C, SPI, and JTAG I/O voltage	OV_{DD}	3.3 V ± 300 mV	V	1
Junction temperature	T_A/T_J	0 to 105	°C	2

Note:
1. GV_{DD}, OV_{DD}, AV_{DD}, and V_{DD} must track each other and must vary in the same direction—either in the positive or negative direction.
2. Minimum temperature is specified with T_A; maximum temperature is specified with T_J.
3. All IO pins should be interfaced with peripherals operating at same voltage level.
4. This voltage is the input to the filter discussed in Section 24.2, "PLL Power Supply Filtering" and not necessarily the voltage at the AVDD pin, which may be reduced due to voltage drop across the filter.

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8323E

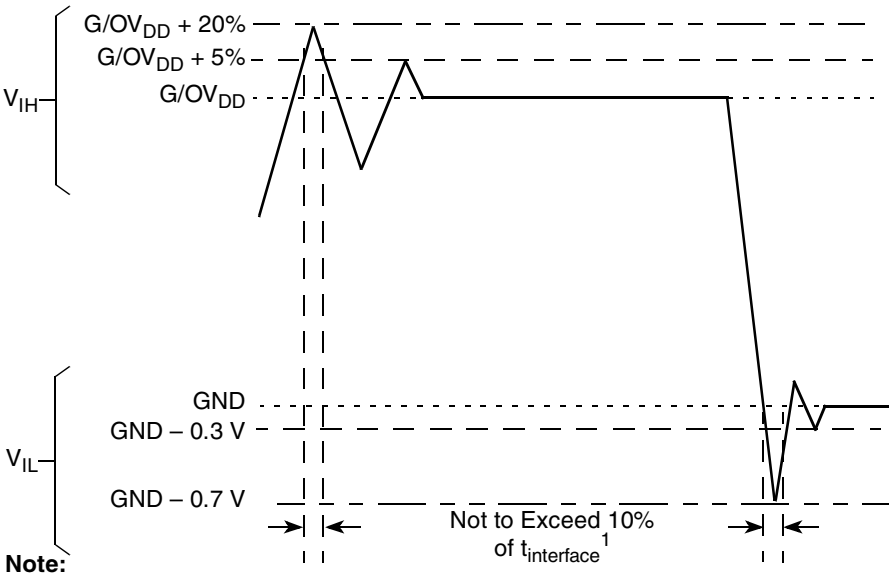

Figure 2. Overshoot/Undershoot Voltage for GV_{DD}/OV_{DD}

6.2 DDR1 and DDR2 SDRAM AC Electrical Characteristics

This section provides the AC electrical characteristics for the DDR1 and DDR2 SDRAM interface.

6.2.1 DDR1 and DDR2 SDRAM Input AC Timing Specifications

Table 16 provides the input AC timing specifications for the DDR2 SDRAM (D*n*_GV_{DD}(typ) = 1.8 V).

Table 16. DDR2 SDRAM Input AC Timing Specifications for 1.8-V Interface

At recommended operating conditions with D*n*_GV_{DD} of 1.8 ± 5%.

Parameter	Symbol	Min	Max	Unit	Notes
AC input low voltage	V_{IL}	—	MVREFn_{REF} – 0.25	V	—
AC input high voltage	V_{IH}	MVREFn_{REF} + 0.25	—	V	—

Table 17 provides the input AC timing specifications for the DDR1 SDRAM (D*n*_GV_{DD}(typ) = 2.5 V).

Table 17. DDR1 SDRAM Input AC Timing Specifications for 2.5 V Interface

At recommended operating conditions with D*n*_GV_{DD} of 2.5 ± 5%.

Parameter	Symbol	Min	Max	Unit	Notes
AC input low voltage	V_{IL}	—	MVREFn_{REF} – 0.31	V	—
AC input high voltage	V_{IH}	MVREFn_{REF} + 0.31	—	V	—

Table 18 provides the input AC timing specifications for the DDR1 and DDR2 SDRAM interface.

Table 18. DDR1 and DDR2 SDRAM Input AC Timing Specifications

At recommended operating conditions with D*n*_GV_{DD} of (1.8 or 2.5 V) ± 5%.

Parameter	Symbol	Min	Max	Unit	Notes
Controller skew for MDQS—MDQ/MDM	t_{CISKEW}			ps	1, 2
266 MHz		–750	750		
200 MHz		–1250	1250		

Notes:

1. t_{CISKEW} represents the total amount of skew consumed by the controller between MDQS[n] and any corresponding bit that is captured with MDQS[n]. This should be subtracted from the total timing budget.
2. The amount of skew that can be tolerated from MDQS to a corresponding MDQ signal is called t_{DISKEW}. This can be determined by the following equation: $t_{DISKEW} = \pm(T/4 - abs(t_{CISKEW}))$ where T is the clock period and $abs(t_{CISKEW})$ is the absolute value of t_{CISKEW}.

Table 26. RMII Receive AC Timing Specifications (continued)

At recommended operating conditions with OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typical	Max	Unit
REF_CLK clock fall time V_{IH}(max) to V_{IL}(min)	t_{RMXF}	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications follow the pattern of $t_{\text{(first three letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{RMRDVKH}$ symbolizes RMII receive timing (RMR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{RMX} clock reference (K) going to the high (H) state or setup time. Also, $t_{RMRDXKL}$ symbolizes RMII receive timing (RMR) with respect to the time data input signals (D) went invalid (X) relative to the t_{RMX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{RMX} represents the RMII (RM) reference (X) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 11 provides the AC test load.

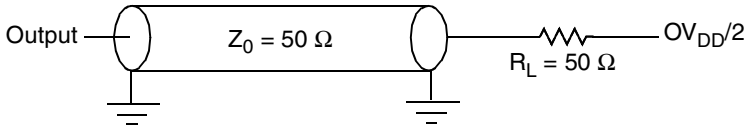

Figure 11. AC Test Load

Figure 12 shows the RMII receive AC timing diagram.

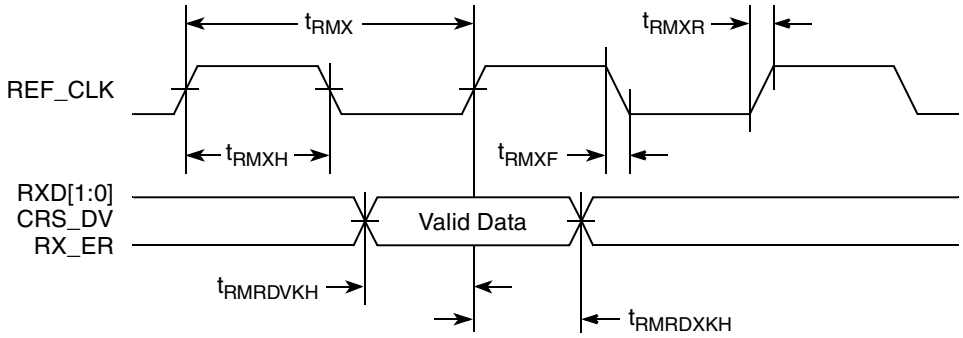

Figure 12. RMII Receive AC Timing Diagram

8.3 Ethernet Management Interface Electrical Characteristics

The electrical characteristics specified here apply to MII management interface signals MDIO (management data input/output) and MDC (management data clock). The electrical characteristics for MII, and RMII are specified in Section 8.1, “Ethernet Controller (10/100 Mbps)—MII/RMII Electrical Characteristics.”

Figure 13 shows the MII management AC timing diagram.

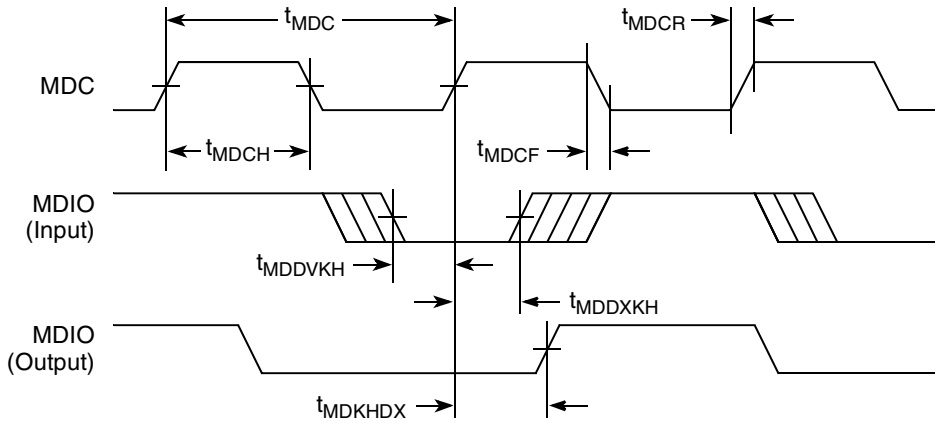

Figure 13. MII Management Interface Timing Diagram

9 Local Bus

This section describes the DC and AC electrical specifications for the local bus interface of the MPC8323E.

9.1 Local Bus DC Electrical Characteristics

Table 29 provides the DC electrical characteristics for the local bus interface.

Table 29. Local Bus DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
High-level output voltage, I_{OH} = –100 µA	V_{OH}	OV_{DD} – 0.2	—	V
Low-level output voltage, I_{OL} = 100 µA	V_{OL}	—	0.2	V
Input current	I_{IN}	—	±5	µA

9.2 Local Bus AC Electrical Specifications

Table 30 describes the general timing parameters of the local bus interface of the MPC8323E.

Table 30. Local Bus General Timing Parameters

Parameter	Symbol[1]	Min	Max	Unit	Notes
Local bus cycle time	t_{LBK}	15	—	ns	2
Input setup to local bus clock (LCLK*n*)	t_{LBIVKH}	7	—	ns	3, 4
Input hold from local bus clock (LCLK*n*)	t_{LBIXKH}	1.0	—	ns	3, 4
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT1}$	1.5	—	ns	5

Table 30. Local Bus General Timing Parameters (continued)

Parameter	Symbol[1]	Min	Max	Unit	Notes
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT2}$	3	—	ns	6
LALE output fall to LAD output transition (LATCH hold time)	$t_{LBOTOT3}$	2.5	—	ns	7
Local bus clock (LCLK*n*) to output valid	t_{LBKHOV}	—	3	ns	3
Local bus clock (LCLK*n*) to output high impedance for LAD/LDP	t_{LBKHOZ}	—	4	ns	8
Local bus clock (LCLK*n*) duty cycle	t_{LBDC}	47	53	%	—
Local bus clock (LCLK*n*) jitter specification	t_{LBRJ}	—	400	ps	—
Delay between the input clock (PCI_SYNC_IN) of local bus output clock (LCLK*n*)	t_{LBCDL}	—	1.7	ns	—

Notes:
1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{LBIXKH1}$ symbolizes local bus timing (LB) for the input (I) to go invalid (X) with respect to the time the t_{LBK} clock reference (K) goes high (H), in this case for clock one(1).
2. All timings are in reference to falling edge of LCLK0 (for all outputs and for $\overline{\text{LGTA}}$ and LUPWAIT inputs) or rising edge of LCLK0 (for all other inputs).
3. All signals are measured from $OV_{DD}/2$ of the rising/falling edge of LCLK0 to $0.4 \times OV_{DD}$ of the signal in question for 3.3-V signaling levels.
4. Input timings are measured at the pin.
5. $t_{LBOTOT1}$ should be used when RCWH[LALE] is not set and the load on LALE output pin is at least 10 pF less than the load on LAD output pins.
6. $t_{LBOTOT2}$ should be used when RCWH[LALE] is set and the load on LALE output pin is at least 10 pF less than the load on LAD output pins.
7. $t_{LBOTOT3}$ should be used when RCWH[LALE] is set and the load on LALE output pin equals to the load on LAD output pins.
8. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.

Figure 14 provides the AC test load for the local bus.

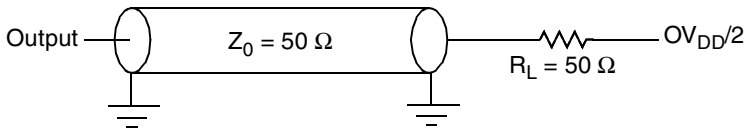

Figure 14. Local Bus C Test Load

Figure 21 provides the boundary-scan timing diagram.

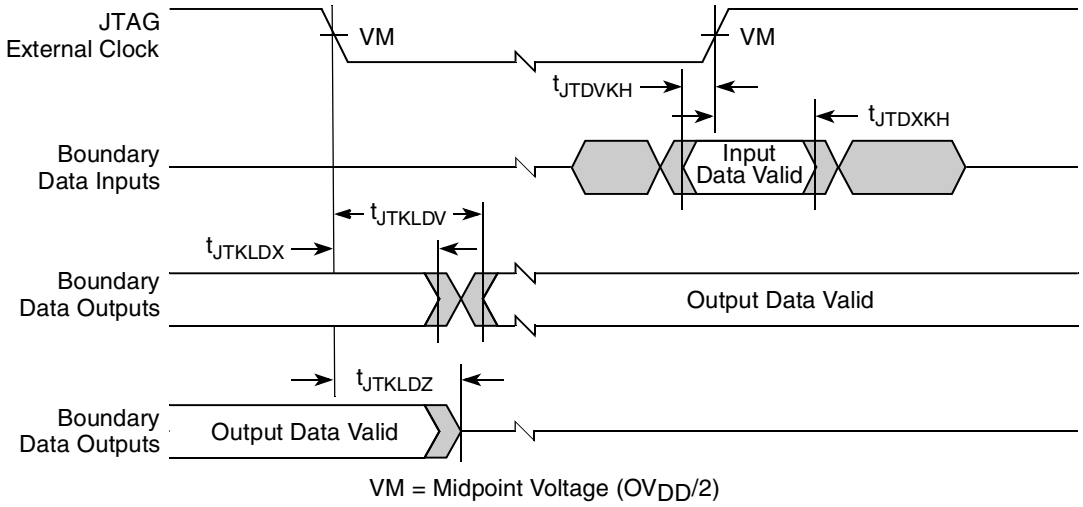

Figure 21. Boundary-Scan Timing Diagram

Figure 22 provides the test access port timing diagram.

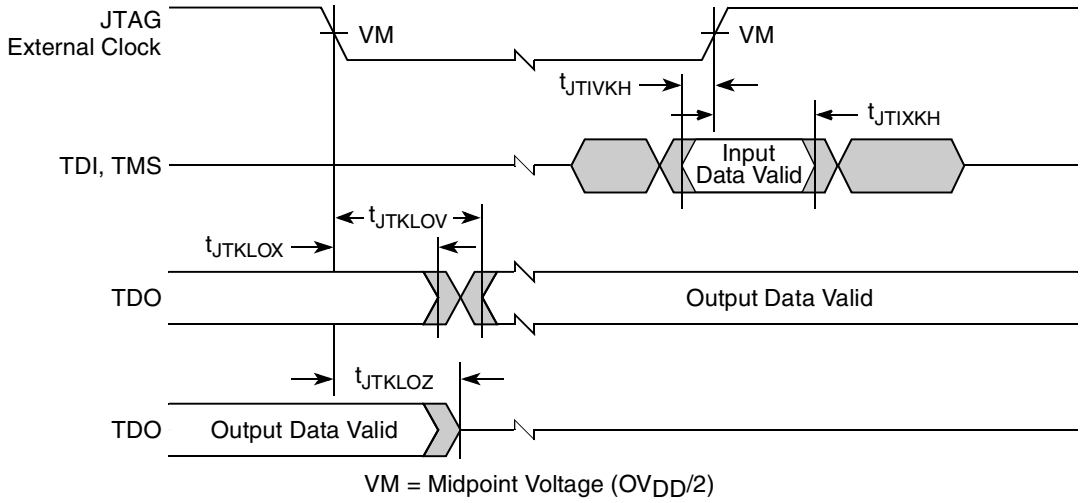

Figure 22. Test Access Port Timing Diagram

12 PCI

This section describes the DC and AC electrical specifications for the PCI bus of the MPC8323E.

12.1 PCI DC Electrical Characteristics

Table 35 provides the DC electrical characteristics for the PCI interface of the MPC8323E.

Table 35. PCI DC Electrical Characteristics[1,2]

Parameter	Symbol	Test Condition	Min	Max	Unit
High-level input voltage	V_{IH}	$V_{OUT} \geq V_{OH}$ (min) or	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	$V_{OUT} \leq V_{OL}$ (max)	–0.3	0.8	V
High-level output voltage	V_{OH}	OV_{DD} = min, I_{OH} = –100 µA	OV_{DD} – 0.2	—	V
Low-level output voltage	V_{OL}	OV_{DD} = min, I_{OL} = 100 µA	—	0.2	V
Input current	I_{IN}	0 V ≤ V_{IN} ≤ OV_{DD}	—	±5	µA

Notes:
1. Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.
2. Ranges listed do not meet the full range of the DC specifications of the *PCI 2.3 Local Bus Specifications*.

12.2 PCI AC Electrical Specifications

This section describes the general AC timing parameters of the PCI bus of the MPC8323E. Note that the PCI_CLK or PCI_SYNC_IN signal is used as the PCI input clock depending on whether the MPC8323E is configured as a host or agent device. Table 36 shows the PCI AC timing specifications at 66 MHz.

Table 36. PCI AC Timing Specifications at 66 MHz

Parameter	Symbol[1]	Min	Max	Unit	Notes
Clock to output valid	t_{PCKHOV}	—	6.0	ns	2
Output hold from clock	t_{PCKHOX}	1	—	ns	2
Clock to output high impedence	t_{PCKHOZ}	—	14	ns	2, 3
Input setup to clock	t_{PCIVKH}	3.0	—	ns	2, 4
Input hold from clock	t_{PCIXKH}	0	—	ns	2, 4

Notes:
1. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the PCI_SYNC_IN clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
2. See the timing measurement conditions in the *PCI 2.3 Local Bus Specifications*.
3. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
4. Input timings are measured at the pin.

Figure 35 provides the AC test load for the UTOPIA.

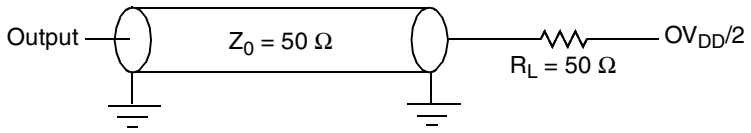

Figure 35. UTOPIA AC Test Load

Figure 36 and Figure 37 represent the AC timing from Table 49. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

Figure 36 shows the UTOPIA timing with external clock.

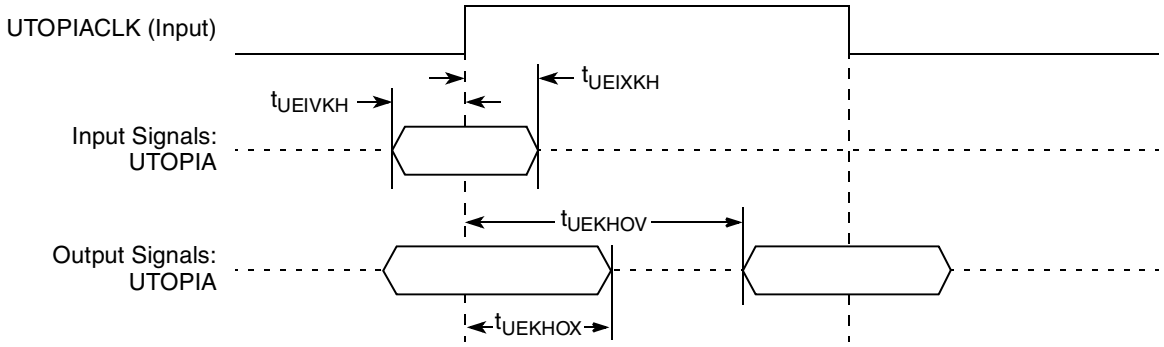

Figure 36. UTOPIA AC Timing (External Clock) Diagram

Figure 37 shows the UTOPIA timing with internal clock.

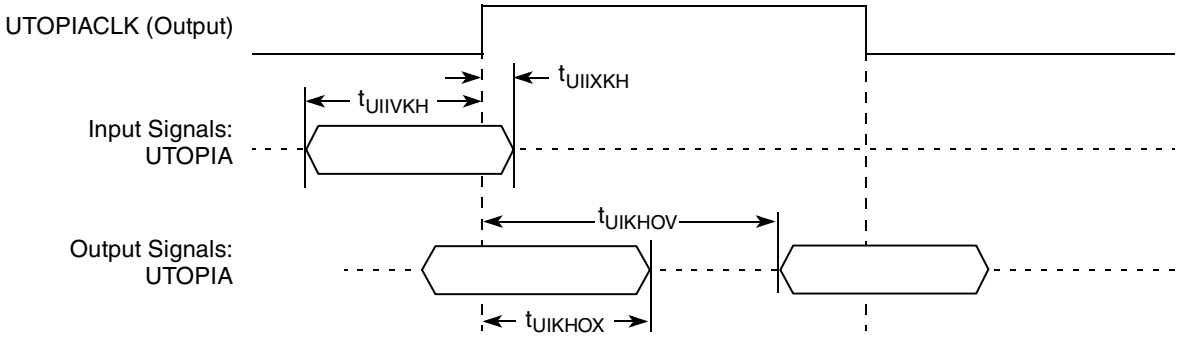

Figure 37. UTOPIA AC Timing (Internal Clock) Diagram

Table 51. HDLC, BISYNC, and Transparent UART AC Timing Specifications[1] (continued)

Characteristic	Symbol[2]	Min	Max	Unit
Inputs—External clock input hold time	t_{HEIXKH}	1	—	ns

Notes:
1. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.
2. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{HIKHOX} symbolizes the outputs internal timing (HI) for the time t_{serial} memory clock reference (K) goes from the high state (H) until outputs (O) are invalid (X).

Table 52. Synchronous UART AC Timing Specifications[1]

Characteristic	Symbol[2]	Min	Max	Unit
Outputs—Internal clock delay	$t_{UAIKHOV}$	0	5.5	ns
Outputs—External clock delay	$t_{UAEKHOV}$	1	10	ns
Outputs—Internal clock high impedance	$t_{UAIKHOX}$	0	5.5	ns
Outputs—External clock high impedance	$t_{UAEKHOX}$	1	8	ns
Inputs—Internal clock input setup time	$t_{UAIIVKH}$	6	—	ns
Inputs—External clock input setup time	$t_{UAEIVKH}$	4	—	ns
Inputs—Internal clock input hold time	$t_{UAIIXKH}$	0	—	ns
Inputs—External clock input hold time	$t_{UAEIXKH}$	1	—	ns

Notes:
1. Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.
2. The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{UAIKHOX}$ symbolizes the outputs internal timing (UAI) for the time t_{serial} memory clock reference (K) goes from the high state (H) until outputs (O) are invalid (X).

Figure 38 provides the AC test load.

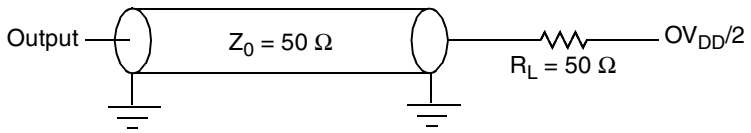

Figure 38. AC Test Load

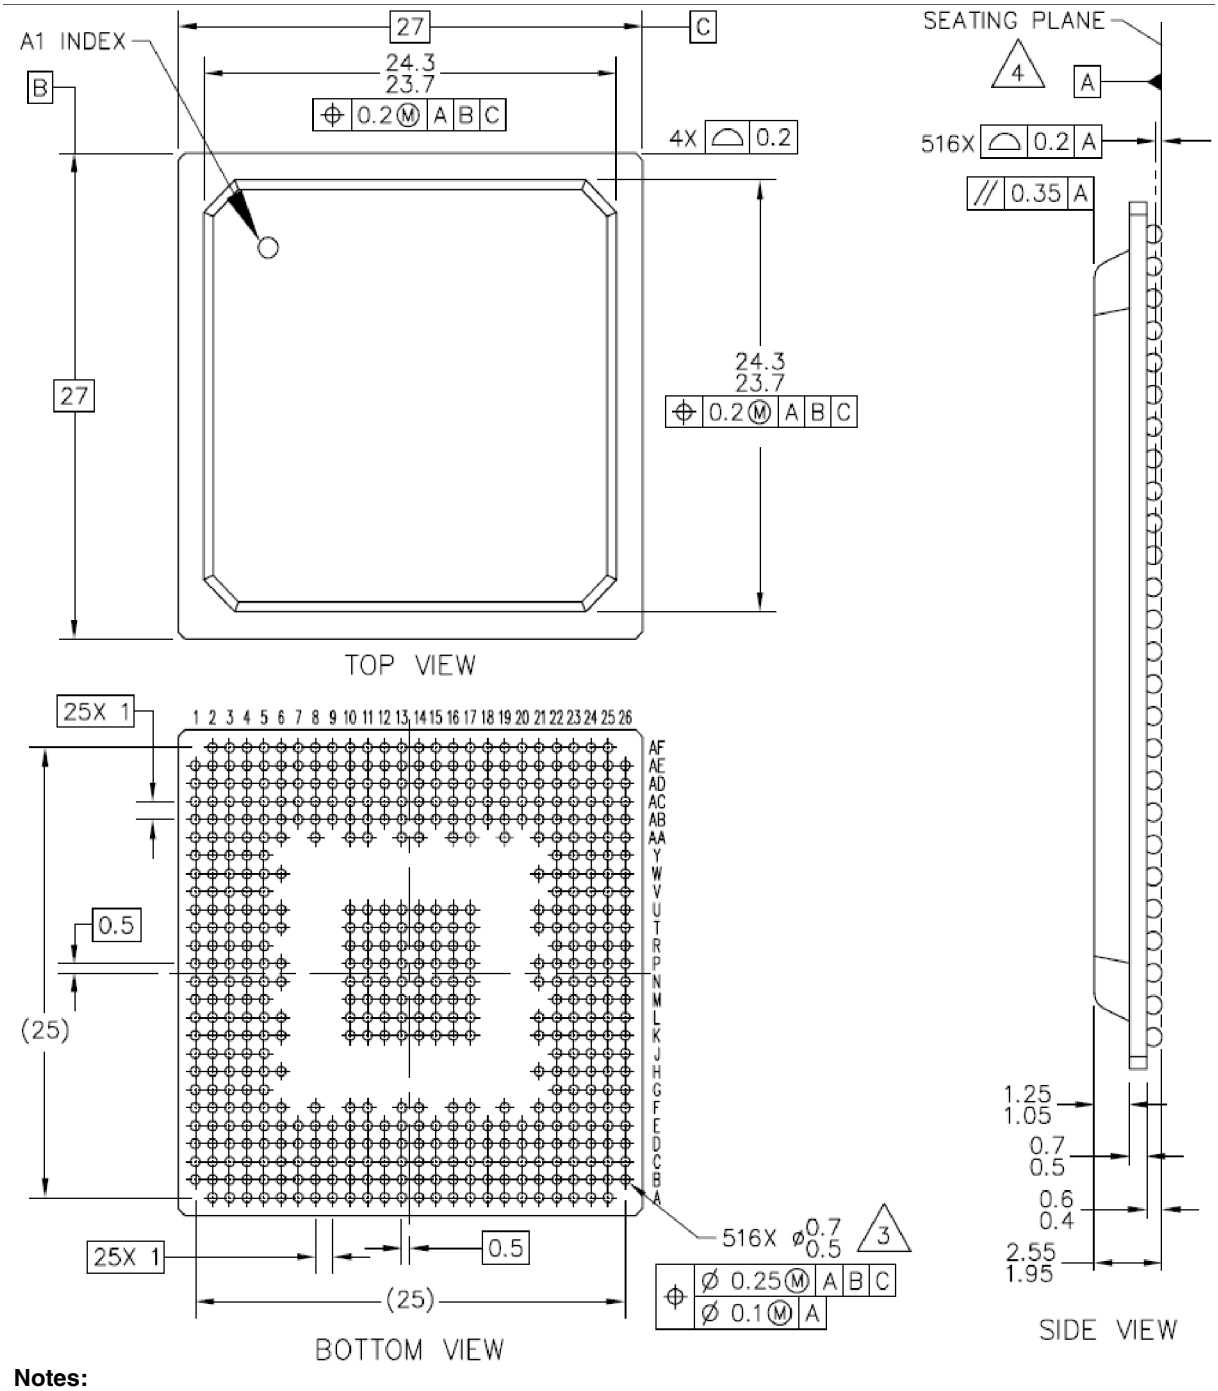
Figure 39 and Figure 40 represent the AC timing from Table 51. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.



Notes:

1.All dimensions are in millimeters.

2.Dimensions and tolerances per ASME Y14.5M-1994.

3.Maximum solder ball diameter measured parallel to datum A.

4.Datum A, the seating plane, is determined by the spherical crowns of the solder balls.

Figure 42. Mechanical Dimensions and Bottom Surface Nomenclature of the MPC8323E PBGA

Table 55. MPC8323E PBGA Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Notes
V_{DD}	K10, K11, K12, K13, K14, K15, K16, K17, L10, L17, M10, M17, N10, N17, P10, P17, R10, R17, T10, T17, U10, U11, U12, U13, U14, U15, U16, U17	V_{DD}	—	—
V_{SS}	B23, E7, E11, E13, E17, E21, F11, F13, F17, F21, F23, G5, H22, K5, K6, L11, L12, L13, L14, L15, L16, L21, M11, M12, M13, M14, M15, M16, N6, N11, N12, N13, N14, N15, N16, P5, P11, P12, P13, P14, P15, P16, P21, R11, R12, R13, R14, R15, R16, R22, T6, T11, T12, T13, T14, T15, T16, U5, U21, V23, W5, W6, W21, W23, W24, Y22, AA5, AA6, AA22, AA25, AB7, AB13, AB19, AB22, AC10, AC12, AC16, AC20	V_{SS}	—	—
No Connect				
NC	C22	—	—	—

Notes:
1. This pin is an open drain signal. A weak pull-up resistor (1 kΩ) should be placed on this pin to OV_{DD}.
2. This pin is an open drain signal. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to OV_{DD}.
3. This output is actively driven during reset rather than being three-stated during reset.
4. These JTAG and local bus pins have weak internal pull-up P-FETs that are always enabled.
5. This pin should have a weak pull up if the chip is in PCI host mode. Follow the PCI specification's recommendation.
6. This pin must always be tied to GND. 7.This pin has weak internal pull-down N-FET that is always enabled.8.Though this pin has weak internal pull-up yet it is recommended to apply an external pull-up.

The *ce_clk* frequency is determined by the QUICC Engine PLL multiplication factor (RCWL[CEPMF) and the QUICC Engine PLL division factor (RCWL[CEPDF]) according to the following equation:

When CLKIN is the primary input clock,

ce_clk = (primary clock input × CEPMF) ÷ (1 + CEPDF)

When PCI_CLK is the primary input clock,

ce_clk = [primary clock input × CEPMF × (1 + ~CFG_CLKIN_DIV)] ÷ (1 + CEPDF)

See the "QUICC Engine PLL Multiplication Factor" section and the "QUICC Engine PLL Division Factor" section in the *MPC8323E PowerQUICC II Pro Communications Processor Reference Manual* for more information.

The DDR SDRAM memory controller operates with a frequency equal to twice the frequency of *csb_clk*. Note that *ddr_clk* is not the external memory bus frequency; *ddr_clk* passes through the DDR clock divider (÷2) to create the differential DDR memory bus clock outputs (MCK and $\overline{\text{MCK}}$). However, the data rate is the same frequency as *ddr_clk*.

The local bus memory controller operates with a frequency equal to the frequency of *csb_clk*. Note that *lbc_clk* is not the external local bus frequency; *lbc_clk* passes through the LBC clock divider to create the external local bus clock outputs (LSYNC_OUT and LCLK[0:2]). The LBC clock divider ratio is controlled by LCRR[CLKDIV]. See the "LBC Bus Clock and Clock Ratios" section in the *MPC8323E PowerQUICC II Pro Communications Processor Reference Manual* for more information.

In addition, some of the internal units may be required to be shut off or operate at lower frequency than the *csb_clk* frequency. These units have a default clock ratio that can be configured by a memory mapped register after the device comes out of reset. Table 56 specifies which units have a configurable clock frequency. Refer to the "System Clock Control Register (SCCR)" section in the *MPC8323E PowerQUICC II Pro Communications Processor Reference Manual* for a detailed description.

Table 56. Configurable Clock Units

Unit	Default Frequency	Options
Security core, I2C, SAP, TPR	*csb_clk*	Off, *csb_clk*/2, *csb_clk*/3
PCI and DMA complex	*csb_clk*	Off, *csb_clk*

NOTE

Setting the clock ratio of these units must be performed prior to any access to them.

Table 57 provides the operating frequencies for the 8323E PBGA under recommended operating conditions (see Table 2).

Table 57. Operating Frequencies for PBGA

Characteristic[1]	Max Operating Frequency	Unit
e300 core frequency (*core_clk*)	333	MHz
Coherent system bus frequency (*csb_clk*)	133	MHz
QUICC Engine frequency (*ce_clk*)	200	MHz

22.5 Core PLL Configuration

RCWL[COREPLL] selects the ratio between the internal coherent system bus clock (*csb_clk*) and the e300 core clock (*core_clk*). Table 60 shows the encodings for RCWL[COREPLL]. COREPLL values not listed in Table 60 should be considered reserved.

Table 60. e300 Core PLL Configuration

RCWL[COREPLL]			***core_clk* : *csb_clk* Ratio**	**VCO Divider**
0-1	**2-5**	**6**		
nn	**0000**	n	PLL bypassed (PLL off, *csb_clk* clocks core directly)	PLL bypassed (PLL off, *csb_clk* clocks core directly)
00	**0001**	0	1:1	÷2
01	**0001**	0	1:1	÷4
10	**0001**	0	1:1	÷8
11	**0001**	0	1:1	÷8
00	**0001**	1	1.5:1	÷2
01	**0001**	1	1.5:1	÷4
10	**0001**	1	1.5:1	÷8
11	**0001**	1	1.5:1	÷8
00	**0010**	0	2:1	÷2
01	**0010**	0	2:1	÷4
10	**0010**	0	2:1	÷8
11	**0010**	0	2:1	÷8
00	**0010**	1	2.5:1	÷2
01	**0010**	1	2.5:1	÷4
10	**0010**	1	2.5:1	÷8
11	**0010**	1	2.5:1	÷8
00	**0011**	0	3:1	÷2
01	**0011**	0	3:1	÷4
10	**0011**	0	3:1	÷8
11	**0011**	0	3:1	÷8

NOTE

Core VCO frequency = core frequency × VCO divider

VCO divider (RCWL[COREPLL[0:1]]) must be set properly so that the core VCO frequency is in the range of 500–800 MHz.

25.2 Part Marking

Parts are marked as in the example shown in Figure 46.

Notes:
ATWLYYWW is the traceability code.
CCCCC is the country code.
MMMMM is the mask number.
YWWLAZ is the assembly traceability code.

Figure 46. Freescale Part Marking for PBGA Devices

26 Document Revision History

Table 67 provides a revision history for this hardware specification.

Table 67. Document Revision History

Rev. No.	Date	Substantive Change(s)
4	09/2010	• Replaced all instances of “LCCR” with “LCRR” throughout. • Added footnotes 3 and 4 in Table 2, “Recommended Operating Conditions[3].” • Modified Section 8.1.1, “DC Electrical Characteristics.” • Modified Table 23, “MII Transmit AC Timing Specifications.” • Modified Table 24, “MII Receive AC Timing Specifications.” • Added footnote 7 and 8, and modified some signal names in Table 55, ”MPC8323E PBGA Pinout Listing.”
3	12/2009	• Removed references for note 4 from Table 1. • Added Figure 2 in Section 2.1.2, “Power Supply Voltage Specification. • Added symbol T_A in Table 2. • Added footnote 2 in Table 2. • Added a note in Section 4, “Clock Input Timing for rise/fall time of QE input pins. • Modified CLKIN, PCI_CLK rise/fall time parameters in Table 8. Modified min value of t_{MCK} in Table 19. • Modified Figure 43. • Modified formula for ce_clk calculation in Section 22.3, “System Clock Domains. • Added a note in Section 22.4, “System PLL Configuration. • Removed the signal ECID_TMODE_IN from Table 55. • Removed all references of RST signals from Table 55.
