Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

IOB Pad Input/Output/3-State

Table 19 (3.3V high-range IOB (HR)) and **Table 20** (1.8V high-performance IOB (HP)) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HP I/O banks, the internal DCI termination turn-on time is always faster than T_{IOTP} when the DCITERMDISABLE pin is used. In HR I/O banks, the IN_TERM termination turn-on time is always faster than T_{IOTP} when the INTERMDISABLE pin is used.

1. To support longer delays in configuration, use the design solutions described in the 7 Series FPGA Configuration User Guide ([UG470](#)).
2. Only during configuration, the last edge is determined by a weak pull-up/pull-down resistor in the I/O.

Date	Version	Description
03/27/2013	1.13	In Table 7 , added values for the XC7VX330T and XC7VX415T devices. Revised Table 15 and Table 16 to include production release of the XC7VX330T and XC7VX415T. In Table 18 , updated the table title, LPDDR2 values, and removed Note 3. Removed Note 2: <i>For QPLL line rate, the maximum line rate with the divider N set to 66 is 10.3125 Gb/s from Table 68.</i>
04/17/2013	1.14	Updated the AC Switching Characteristics section with production release changes to Table 15 and Table 16 for XC7VX550T for all speed specifications. In Table 1 , revised V_{IN} (I/O input voltage) to match values in Table 4 and Table 5 , and combined Note 4 with old Note 5 and then added new Note 5. Revised V_{IN} description and added Note 8 in Table 2 . Updated first 3 rows in Table 4 and Table 5 . Updated values and added new values to Table 7 . Also revised PCI33_3 voltage minimum in Table 10 to match values in Table 1 , Table 4 , and Table 5 . Added Note 1 to Table 12 and Table 13 . Throughout the data sheet (Table 29 , Table 30 , and Table 45) removed the obvious note "A Zero "0" Hold Time listing indicates no hold time or a negative hold time." Updated and clarified USRCLK data in Table 57 and Table 72 .
