Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Notes:

1. All voltages are relative to ground.
2. For the design of the power distribution system, consult the *7 Series FPGAs PCB Design and Pin Planning Guide* ([UG483](#)).
3. V_{CCINT} and V_{CCBRAM} should be connected to the same supply.
4. For more information on the VID bit see the *Lowering Power using the Voltage Identification Bit* application note ([XAPP555](#)).
5. Configuration data is retained even if V_{CCO} drops to 0V.
6. Includes V_{CCO} of 1.2V, 1.5V, 1.8V, 2.5V, and 3.3V.
7. The lower absolute voltage specification always applies.
8. See [Table 10](#) for TMDS_33 specifications.
9. A total of 200 mA per bank should not be exceeded.
10. V_{CCBATT} is required only when using bitstream encryption. If battery is not used, connect V_{CCBATT} to either ground or V_{CCAUX}.
11. Each voltage listed requires the filter circuit described in the *7 Series FPGAs GTX/GTH Transceiver User Guide* ([UG476](#)).
12. For data rates $\leq 10.3125 \text{ Gb/s}$, V_{MGTAVCC} should be 1.0V $\pm 3\%$ for lower power consumption.
13. For lower power consumption, V_{MGTAVCC} should be 1.0V $\pm 3\%$ over the entire CPLL frequency range.

Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 15](#) correlates the current status of each Virtex-7 T and XT device on a per speed grade basis.

Production Silicon and Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

[Table 16](#) lists the production released Virtex-7 T and XT device, speed grade, and the minimum corresponding supported speed specification version and software revisions. The software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

Notes:

1. This I/O standard is only available in the 1.8V high-performance (HP) banks.

Table 21 specifies the values of T_{IOTPHZ} and T_{IOIBUFDISABLE}. T_{IOTPHZ} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). T_{IOIBUFDISABLE} is described as the IOB delay from IBUFDISABLE to O output. In HP I/O banks, the internal DCI termination turn-off time is always faster than T_{IOTPHZ} when the DCITERMDISABLE pin is used. In HR I/O banks, the internal IN_TERM termination turn-off time is always faster than T_{IOTPHZ} when the INTERMDISABLE pin is used.

Notes:

1. The MMCM does not filter typical spread-spectrum input clocks because they are usually far below the bandwidth filter frequencies.
2. The static offset is measured between any MMCM outputs with identical phase.
3. Values for this parameter are available in the Clocking Wizard.
See http://www.xilinx.com/products/intellectual-property/clocking_wizard.htm.
4. Includes global clock buffer.
5. Calculated as $F_{VCO}/128$ assuming output duty cycle is 50%.
6. When CLKOUT4_CASCADE = TRUE, MMCM_F_OUTMIN is 0.036 MHz.
