

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	27648
Number of I/O	75
Number of Gates	90000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/afs090-1fg256i

The system application, Level 3, is the larger user application that utilizes one or more applets. Designing at the highest level of abstraction supported by the Fusion technology stack, the application can be easily created in FPGA gates by importing and configuring multiple applets.

In fact, in some cases an entire FPGA system design can be created without any HDL coding.

An optional MCU enables a combination of software and HDL-based design methodologies. The MCU can be on-chip or off-chip as system requirements dictate. System portioning is very flexible, allowing the MCU to reside above the applets or to absorb applets, or applets and backbone, if desired.

The Fusion technology stack enables a very flexible design environment. Users can engage in design across a continuum of abstraction from very low to very high.

Core Architecture

VersaTile

Based upon successful ProASIC3/E logic architecture, Fusion devices provide granularity comparable to gate arrays. The Fusion device core consists of a sea-of-VersaTiles architecture.

As illustrated in [Figure 2-2](#), there are four inputs in a logic VersaTile cell, and each VersaTile can be configured using the appropriate flash switch connections:

- Any 3-input logic function
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set (on a 4th input)

VersaTiles can flexibly map the logic and sequential gates of a design. The inputs of the VersaTile can be inverted (allowing bubble pushing), and the output of the tile can connect to high-speed, very-long-line routing resources. VersaTiles and larger functions are connected with any of the four levels of routing hierarchy.

When the VersaTile is used as an enable D-flip-flop, the SET/CLR signal is supported by a fourth input, which can only be routed to the core cell over the VersaNet (global) network.

The output of the VersaTile is F2 when the connection is to the ultra-fast local lines, or YL when the connection is to the efficient long-line or very-long-line resources ([Figure 2-2](#)).

Note: *This input can only be connected to the global clock distribution network.

Figure 2-2 • Fusion Core VersaTile

Figure 2-10 • Very-Long-Line Resources

RC Oscillator

The RC oscillator is an on-chip free-running clock source generating a 100 MHz clock. It can be used as a source clock for both on-chip and off-chip resources. When used in conjunction with the Fusion PLL and CCC circuits, the RC oscillator clock source can be used to generate clocks of varying frequency and phase.

The Fusion RC oscillator is very accurate at $\pm 1\%$ over commercial temperature ranges and $\pm 3\%$ over industrial temperature ranges. It is an automated clock, requiring no setup or configuration by the user. It requires only that the power and GNDOSC pins be connected; no external components are required. The RC oscillator can be used to drive either a PLL or another internal signal.

RC Oscillator Characteristics

Table 2-9 • Electrical Characteristics of RC Oscillator

Parameter	Description	Conditions	Min.	Typ.	Max.	Units
F_{RC}	Operating Frequency			100		MHz
	Accuracy	Temperature: 0°C to 85°C Voltage: 3.3 V $\pm$ 5%		1		%
		Temperature: -40°C to 125°C Voltage: 3.3 V $\pm$ 5%		3		%
	Output Jitter	Period Jitter (at 5 k cycles)		100		ps
		Cycle–Cycle Jitter (at 5 k cycles)		100		ps
		Period Jitter (at 5 k cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply		150		ps
		Cycle–Cycle Jitter (at 5 k cycles) with 1 KHz / 300 mV peak-to-peak noise on power supply		150		ps
	Output Duty Cycle			50		%
I_{DYNRC}	Operating Current			1		mA

Table 2-16 • RTC Control/Status Register

Bit	Name	Description	Default Value
7	rtc_rst	RTC Reset 1 – Resets the RTC 0 – Deassert reset on after two ACM_CLK cycle.	
6	cntr_en	Counter Enable 1 – Enables the counter; rtc_rst must be deasserted as well. First counter increments after 64 RTCCLK positive edges. 0 – Disables the crystal prescaler but does not reset the counter value. Counter value can only be updated when the counter is disabled.	0
5	vr_en_mat	Voltage Regulator Enable on Match 1 – Enables RTCMATCH and RTCPSMMATCH to output 1 when the counter value equals the Match Register value. This enables the 1.5 V voltage regulator when RTCPSMMATCH connects to the RTCPSMMATCH signal in VRPSM. 0 – RTCMATCH and RTCPSMMATCH output 0 at all times.	0
4:3	xt_mode[1:0]	Crystal Mode Controls RTCXTLMODE[1:0]. Connects to RTC_MODE signal in XTLOSC. XTL_MODE uses this value when xtal_en is 1. See the "Crystal Oscillator" section on page 2-20 for mode configuration.	00
2	rst_cnt_omat	Reset Counter on Match 1 – Enables the sync clear of the counter when the counter value equals the Match Register value. The counter clears on the rising edge of the clock. If all the Match Registers are set to 0, the clear is disabled. 0 – Counter increments indefinitely	0
1	rstb_cnt	Counter Reset, active Low 0 - Resets the 40-bit counter value	0
0	xtal_en	Crystal Enable Controls RTCXTLSEL. Connects to SELMODE signal in XTLOSC. 0 – XTLOSC enables control by FPGA_EN; xt_mode is not used. Sleep mode requires this bit to equal 0. 1 – Enables XTLOSC, XTL_MODE control by xt_mode Standby mode requires this bit to be set to 1. See the "Crystal Oscillator" section on page 2-20 for further details on SELMODE configuration.	0

The third part of the Analog Quad is called the Gate Driver Block, and its output pin is named AG. This section is used to drive an external FET. There are two modes available: a High Current Drive mode and a Current Source Control mode. Both negative and positive voltage polarities are available, and in the current source control mode, four different current levels are available.

The fourth section of the Analog Quad is called the Temperature Monitor Block, and its input pin name is AT. This block is similar to the Voltage Monitor Block, except that it has an additional function: it can be used to monitor the temperature of an external diode-connected transistor. It has a modified prescaler and is limited to positive voltages only.

The Analog Quad can be configured during design time by Libero SoC; however, the ACM can be used to change the parameters of any of these I/Os during runtime. This type of change is referred to as a context switch. The Analog Quad is a modular structure that is replicated to generate the analog I/O resources. Each Fusion device supports between 5 and 10 Analog Quads.

The analog pads are numbered to clearly identify both the type of pad (voltage, current, gate driver, or temperature pad) and its corresponding Analog Quad (AV0, AC0, AG0, AT0, AV1, ..., AC9, AG9, and AT9). There are three types of input pads (AVx, ACx, and ATx) and one type of analog output pad (AGx). Since there can be up to 10 Analog Quads on a device, there can be a maximum of 30 analog input pads and 10 analog output pads.

Figure 2-65 • Analog Quad

Timing Characteristics

Table 2-55 • Analog Configuration Multiplexer (ACM) Timing
 Commercial Temperature Range Conditions: $T_J = 70^{\circ}\text{C}$, Worst-Case $V_{CC} = 1.425\text{ V}$

Parameter	Description	-2	-1	Std.	Units
$t_{CLKQACM}$	Clock-to-Q of the ACM	19.73	22.48	26.42	ns
t_{SUDACM}	Data Setup time for the ACM	4.39	5.00	5.88	ns
t_{HDACM}	Data Hold time for the ACM	0.00	0.00	0.00	ns
t_{SUAACM}	Address Setup time for the ACM	4.73	5.38	6.33	ns
t_{HAACM}	Address Hold time for the ACM	0.00	0.00	0.00	ns
t_{SUEACM}	Enable Setup time for the ACM	3.93	4.48	5.27	ns
t_{HEACM}	Enable Hold time for the ACM	0.00	0.00	0.00	ns
$t_{MPWARACM}$	Asynchronous Reset Minimum Pulse Width for the ACM	10.00	10.00	10.00	ns
$t_{REMARACM}$	Asynchronous Reset Removal time for the ACM	12.98	14.79	17.38	ns
$t_{RECARACM}$	Asynchronous Reset Recovery time for the ACM	12.98	14.79	17.38	ns
$t_{MPWCLKACM}$	Clock Minimum Pulse Width for the ACM	45.00	45.00	45.00	ns
$t_{FMAXCLKACM}$	lock Maximum Frequency for the ACM	10.00	10.00	10.00	MHz

Solution 3

The board-level design must ensure that the reflected waveform at the pad does not exceed limits provided in [Table 3-4 on page 3-4](#). This is a long-term reliability requirement.

This scheme will also work for a 3.3 V PCI/PCIX configuration, but the internal diode should not be used for clamping, and the voltage must be limited by the bus switch, as shown in [Figure 2-105](#). Relying on the diode clamping would create an excessive pad DC voltage of $3.3\text{ V} + 0.7\text{ V} = 4\text{ V}$.

Figure 2-105 • Solution 3

Solution 4

Figure 2-106 • Solution 4

Table 2-77 • Comparison Table for 5 V–Compliant Receiver Scheme

Scheme	Board Components	Speed	Current Limitations
1	Two resistors	Low to high ¹	Limited by transmitter's drive strength
2	Resistor and Zener 3.3 V	Medium	Limited by transmitter's drive strength
3	Bus switch	High	N/A
4	Minimum resistor value ² R = 47 Ω at T _J = 70°C R = 150 Ω at T _J = 85°C R = 420 Ω at T _J = 100°C	Medium	Maximum diode current at 100% duty cycle, signal constantly at '1' 52.7 mA at T _J = 70°C / 10-year lifetime 16.5 mA at T _J = 85°C / 10-year lifetime 5.9 mA at T _J = 100°C / 10-year lifetime For duty cycles other than 100%, the currents can be increased by a factor = 1 / (duty cycle). Example: 20% duty cycle at 70°C Maximum current = (1 / 0.2) * 52.7 mA = 5 * 52.7 mA = 263.5 mA

Notes:

1. Speed and current consumption increase as the board resistance values decrease.
2. Resistor values ensure I/O diode long-term reliability.

Figure 2-112 • Timing Diagram (with skew circuit selected)

Weak Pull-Up and Weak Pull-Down Resistors

Fusion devices support optional weak pull-up and pull-down resistors for each I/O pin. When the I/O is pulled up, it is connected to the VCCI of its corresponding I/O bank. When it is pulled down, it is connected to GND. Refer to [Table 2-97 on page 2-171](#) for more information.

Slew Rate Control and Drive Strength

Fusion devices support output slew rate control: high and low. The high slew rate option is recommended to minimize the propagation delay. This high-speed option may introduce noise into the system if appropriate signal integrity measures are not adopted. Selecting a low slew rate reduces this kind of noise but adds some delays in the system. Low slew rate is recommended when bus transients are expected. Drive strength should also be selected according to the design requirements and noise immunity of the system.

The output slew rate and multiple drive strength controls are available in LVTTTL/LVCMOS 3.3 V, LVCMOS 2.5 V, LVCMOS 2.5 V / 5.0 V input, LVCMOS 1.8 V, and LVCMOS 1.5 V. All other I/O standards have a high output slew rate by default.

For Fusion slew rate and drive strength specifications, refer to the appropriate I/O bank table:

- Fusion Standard I/O ([Table 2-78 on page 2-152](#))
- Fusion Advanced I/O ([Table 2-79 on page 2-152](#))
- Fusion Pro I/O ([Table 2-80 on page 2-152](#))

[Table 2-83 on page 2-155](#) lists the default values for the above selectable I/O attributes as well as those that are preset for each I/O standard.

Refer to [Table 2-78](#), [Table 2-79](#), and [Table 2-80 on page 2-152](#) for SLEW and OUT_DRIVE settings. [Table 2-81 on page 2-153](#) and [Table 2-82 on page 2-154](#) list the I/O default attributes. [Table 2-83 on page 2-155](#) lists the voltages for the supported I/O standards.

Table 2-92 • Summary of I/O Timing Characteristics – Software Default Settings

SSTL3 Class II

Stub-Speed Terminated Logic for 3.3 V memory bus standard (JESD8-8). Fusion devices support Class II. This provides a differential amplifier input buffer and a push-pull output buffer.

Table 2-165 • Minimum and Maximum DC Input and Output Levels

SSTL3 Class II	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL ¹	IIH ²
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA ³	Max. mA ³	μA ⁴	μA ⁴
21 mA	−0.3	VREF − 0.2	VREF + 0.2	3.6	0.5	VCCI − 0.9	21	21	109	103	10	10

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
2. IIH is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at high temperature (100°C junction temperature) and maximum voltage.
4. Currents are measured at 85°C junction temperature.

Figure 2-133 • AC Loading

Table 2-166 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C _{LOAD} (pF)
VREF − 0.2	VREF + 0.2	1.5	1.5	1.485	30

Note: *Measuring point = V_{trip} . See Table 2-90 on page 2-166 for a complete table of trip points.

Timing Characteristics

Table 2-167 • SSTL3- Class II

Commercial Temperature Range Conditions: $T_J = 70^\circ\text{C}$, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 3.0 V, VREF = 1.5 V

Speed Grade	t _{DOUT}	t _{DP}	t _{DIN}	t _{PY}	t _{EOUT}	t _{ZL}	t _{ZH}	t _{LZ}	t _{HZ}	t _{ZLS}	t _{ZHS}	Units
Std.	0.66	2.07	0.04	1.25	0.43	2.10	1.67			4.34	3.91	ns
−1	0.56	1.76	0.04	1.06	0.36	1.79	1.42			3.69	3.32	ns
−2	0.49	1.54	0.03	0.93	0.32	1.57	1.25			3.24	2.92	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Differential I/O Characteristics

Configuration of the I/O modules as a differential pair is handled by the Microsemi Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

LVDS

Low-Voltage Differential Signal (ANSI/TIA/EIA-644) is a high-speed differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-134](#). The building blocks of the LVDS transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Figure 2-134 • LVDS Circuit Diagram and Board-Level Implementation

Table 2-168 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI	Supply Voltage	2.375	2.5	2.625	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VOH	Input High Voltage	1.25	1.425	1.6	V
IOL ¹	Output Low Voltage	0.65	0.91	1.16	mA
IOH ¹	Output High Voltage	0.65	0.91	1.16	mA
VI	Input Voltage	0		2.925	V
IIL ^{2,3}	Input Low Voltage			10	μA
IIH ^{2,4}	Input High Voltage			10	μA
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM	Input Common Mode Voltage	0.05	1.25	2.35	V
VIDIFF	Input Differential Voltage	100	350		mV

Notes:

1. IOL/IOH defined by VODIFF/(Resistor Network)
2. Currents are measured at 85°C junction temperature.
3. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
4. IIH is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-136](#). The building blocks of the LVPECL transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Figure 2-136 • LVPECL Circuit Diagram and Board-Level Implementation

Table 2-171 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units
VCCI	Supply Voltage	3.0		3.3		3.6		V
VOL	Output Low Voltage	0.96	1.27	1.06	1.43	1.30	1.57	V
VOH	Output High Voltage	1.8	2.11	1.92	2.28	2.13	2.41	V
VIL, VIH	Input Low, Input High Voltages	0	3.6	0	3.6	0	3.6	V
VODIFF	Differential Output Voltage	0.625	0.97	0.625	0.97	0.625	0.97	V
VOCM	Output Common Mode Voltage	1.762	1.98	1.762	1.98	1.762	1.98	V
VICM	Input Common Mode Voltage	1.01	2.57	1.01	2.57	1.01	2.57	V
VIDIFF	Input Differential Voltage	300		300		300		mV

Table 2-172 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)
1.64	1.94	Cross point	–

Note: *Measuring point = V_{trip} . See [Table 2-90 on page 2-166](#) for a complete table of trip points.

Timing Characteristics

Table 2-173 • LVPECL

Commercial Temperature Range Conditions: $T_J = 70^\circ\text{C}$, Worst-Case VCC = 1.425 V,
Worst-Case VCCI = 3.0 V
Applicable to Pro I/Os

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	Units
Std.	0.66	2.14	0.04	1.63	ns
–1	0.56	1.82	0.04	1.39	ns
–2	0.49	1.60	0.03	1.22	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to [Table 3-7 on page 3-9](#).

TMS Test Mode Select

The TMS pin controls the use of the IEEE1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the TAP is held in reset mode. The resistor values must be chosen from [Table 2-183](#) and must satisfy the parallel resistance value requirement. The values in [Table 2-183](#) correspond to the resistor recommended when a single device is used and to the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entering an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 k Ω will satisfy the requirements.

Special Function Pins

NC No Connect

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC Don't Connect

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

NCAP Negative Capacitor

Negative Capacitor is where the negative terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 μ F recommended value, is required to connect between PCAP and NCAP.

PCAP Positive Capacitor

Positive Capacitor is where the positive terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 μ F recommended value, is required to connect between PCAP and NCAP.

PUB Push Button

Push button is the connection for the external momentary switch used to turn on the 1.5 V voltage regulator and can be floating if not used.

PTBASE Pass Transistor Base

Pass Transistor Base is the control signal of the voltage regulator. This pin should be connected to the base of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

PTEM Pass Transistor Emitter

Pass Transistor Emitter is the feedback input of the voltage regulator.

This pin should be connected to the emitter of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

XTAL1 Crystal Oscillator Circuit Input

Input to crystal oscillator circuit. Pin for connecting external crystal, ceramic resonator, RC network, or external clock input. When using an external crystal or ceramic oscillator, external capacitors are also recommended (Please refer to the crystal oscillator manufacturer for proper capacitor value).

If using external RC network or clock input, XTAL1 should be used and XTAL2 left unconnected. In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating.

Table 3-8 • AFS1500 Quiescent Supply Current Characteristics (continued)

Parameter	Description	Conditions	Temp.	Min.	Typ.	Max.	Unit
IJTAG	JTAG I/O quiescent current	Operational standby ⁴ , VJTAG = 3.63 V	T _J = 25°C		80	100	μA
			T _J = 85°C		80	100	μA
			T _J = 100°C		80	100	μA
		Standby mode ⁵ or Sleep mode ⁶ , VJTAG = 0 V			0	0	μA
IPP	Programming supply current	Non-programming mode, VPUMP = 3.63 V	T _J = 25°C		39	80	μA
			T _J = 85°C		40	80	μA
			T _J = 100°C		40	80	μA
		Standby mode ⁵ or Sleep mode ⁶ , VPUMP = 0 V			0	0	μA
ICCNVM	Embedded NVM current	Reset asserted, V _{CCNVM} = 1.575 V	T _J = 25°C		50	150	μA
			T _J = 85°C		50	150	μA
			T _J = 100°C		50	150	μA
ICCPLL	1.5 V PLL quiescent current	Operational standby , VCCPLL = 1.575 V	T _J = 25°C		130	200	μA
			T _J = 85°C		130	200	μA
			T _J = 100°C		130	200	μA

Notes:

1. ICC is the 1.5 V power supplies, ICC and ICC15A.
2. ICC33A includes ICC33A, ICC33PMP, and ICCOSC.
3. ICCI includes all ICCI0, ICCI1, ICCI2, and ICCI4.
4. Operational standby is when the Fusion device is powered up, all blocks are used, no I/O is toggling, Voltage Regulator is loaded with 200 mA, VCC33PMP is ON, XTAL is ON, and ADC is ON.
5. XTAL is configured as high gain, VCC = VJTAG = VPUMP = 0 V.
6. Sleep Mode, VCC = VJTAG = VPUMP = 0 V.
