
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	27648
Number of I/O	75
Number of Gates	90000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/afs090-fg256

Global Resource Characteristics

AFS600 VersaNet Topology

Clock delays are device-specific. Figure 2-15 is an example of a global tree used for clock routing. The global tree presented in Figure 2-15 is driven by a CCC located on the west side of the AFS600 device. It is used to drive all D-flip-flops in the device.

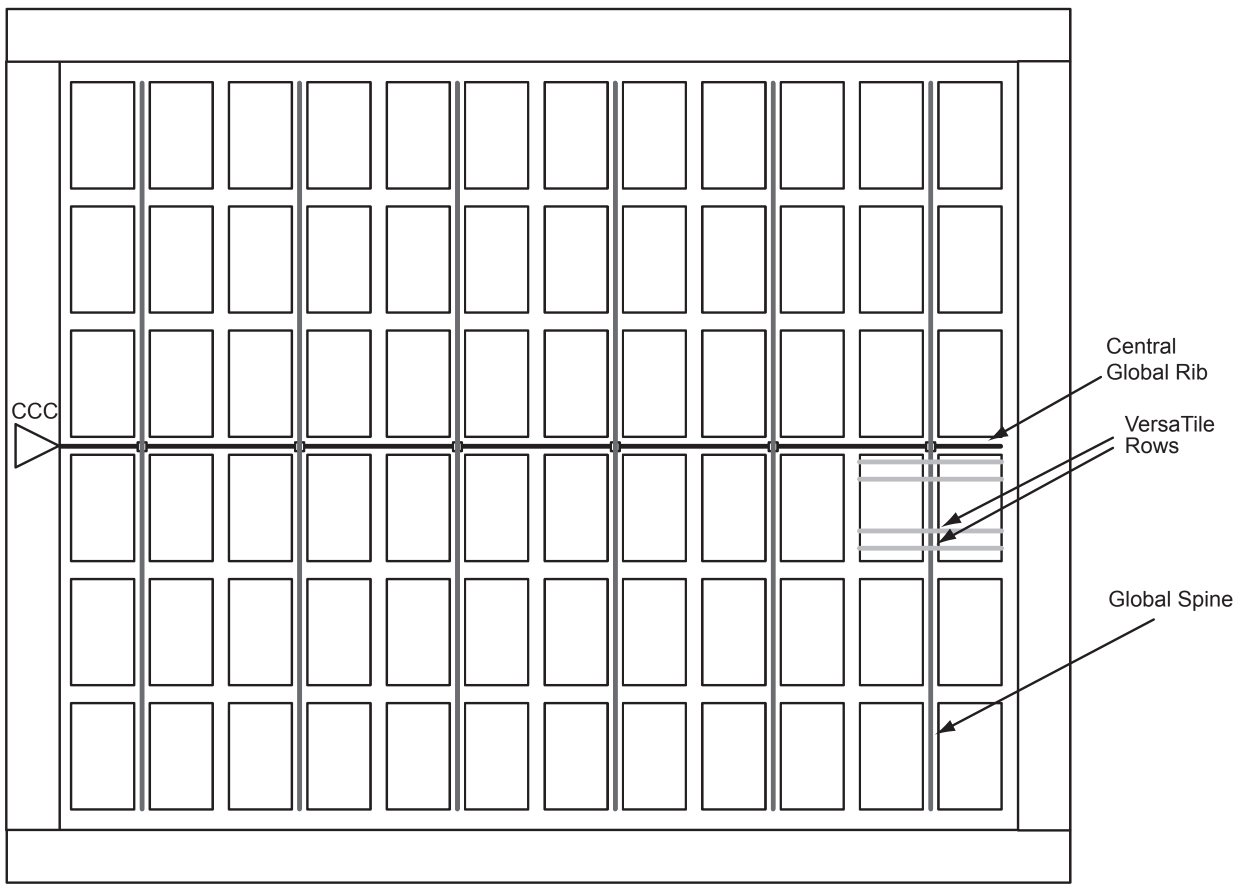

Figure 2-15 • **Example of Global Tree Use in an AFS600 Device for Clock Routing**

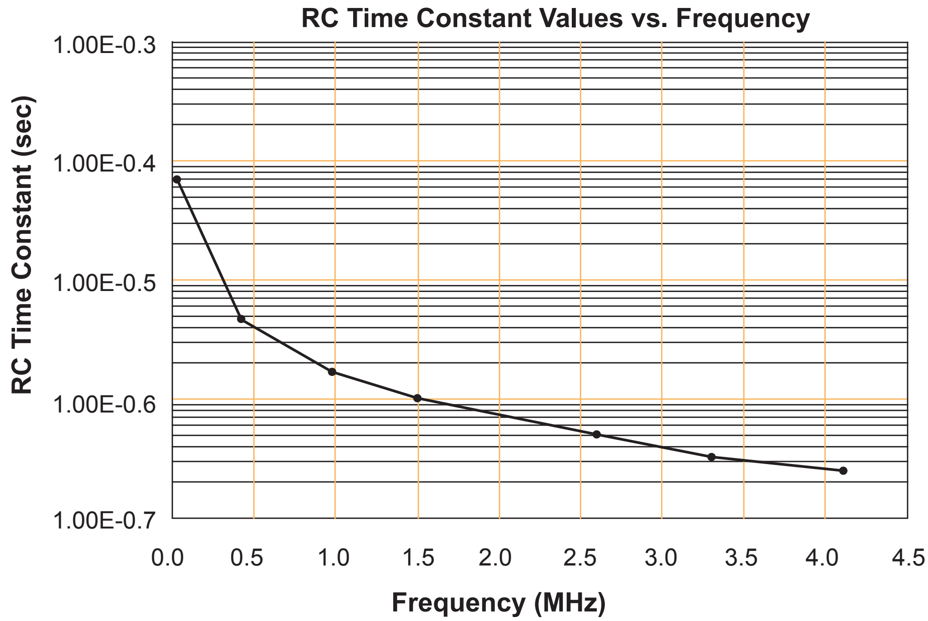

Figure 2-18 • **Crystal Oscillator: RC Time Constant Values vs. Frequency (typical)**

Table 2-10 **• XTLOSC Signals Descriptions**

Signal Name	Width	Direction	Function		
XTL_EN*	1		Enables the crystal. Active high.		
XTL_MODE*	2		Settings for the crystal clock for different frequency.		
			Value	**Modes**	**Frequency Range**
			b'00	RC network	32 KHz to 4 MHz
			b'01	Low gain	32 to 200 KHz
			b'10	Medium gain	0.20 to 2.0 MHz
			b'11	High gain	2.0 to 20.0 MHz
SELMODE	1	IN	Selects the source of XTL_MODE and also enables the XTL_EN. Connect from RTCXTLSEL from AB.		
			0	For normal operation or sleep mode, XTL_EN depends on FPGA_EN, XTL_MODE depends on MODE	
			1	For Standby mode, XTL_EN is enabled, XTL_MODE depends on RTC_MODE	
RTC_MODE[1:0]	2	IN	Settings for the crystal clock for different frequency ranges. XTL_MODE uses RTC_MODE when SELMODE is '1'.		
MODE[1:0]	2	IN	Settings for the crystal clock for different frequency ranges. XTL_MODE uses MODE when SELMODE is '0'. In Standby, MODE inputs will be 0's.		
FPGA_EN*	1	IN	0 when 1.5 V is not present for VCC 1 when 1.5 V is present for VCC		
XTL	1	IN	Crystal Clock source		
CLKOUT	1	OUT	Crystal Clock output		

*Note: *Internal signal—does not exist in macro.*

Global Buffers with No Programmable Delays

The CLKBUF and CLKBUF_LVPECL/LVDS macros are composite macros that include an I/O macro driving a global buffer, hardwired together (Figure 2-20).

The CLKINT macro provides a global buffer function driven by the FPGA core.

The CLKBUF, CLKBUF_LVPECL/LVDS, and CLKINT macros are pass-through clock sources and do not use the PLL or provide any programmable delay functionality.

Many specific CLKBUF macros support the wide variety of single-ended and differential I/O standards supported by Fusion devices. The available CLKBUF macros are described in the *IGLOO, ProASIC3, SmartFusion and Fusion Macro Library Guide*.

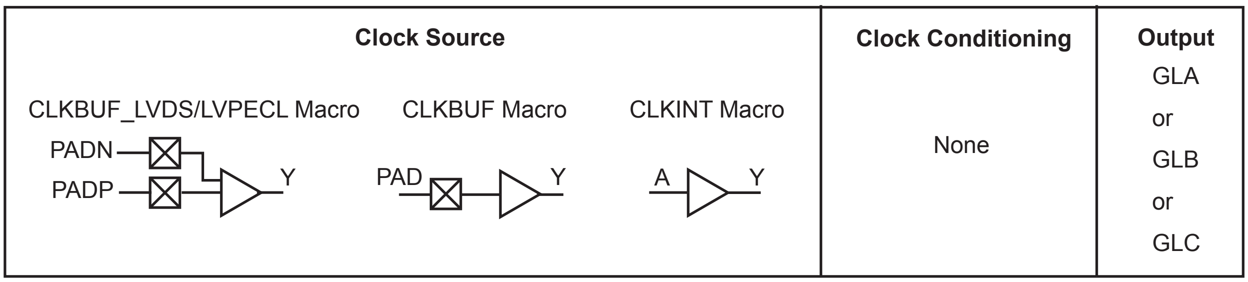

Figure 2-20 • Global Buffers with No Programmable Delay

Global Buffers with Programmable Delay

The CLKDLY macro is a pass-through clock source that does not use the PLL, but provides the ability to delay the clock input using a programmable delay (Figure 2-21 on page 2-25). The CLKDLY macro takes the selected clock input and adds a user-defined delay element. This macro generates an output clock phase shift from the input clock.

The CLKDLY macro can be driven by an INBUF macro to create a composite macro, where the I/O macro drives the global buffer (with programmable delay) using a hardwired connection. In this case, the I/O must be placed in one of the dedicated global I/O locations.

Many specific INBUF macros support the wide variety of single-ended and differential I/O standards supported by the Fusion family. The available INBUF macros are described in the *IGLOO, ProASIC3, SmartFusion and Fusion Macro Library Guide.*

The CLKDLY macro can be driven directly from the FPGA core.

The CLKDLY macro can also be driven from an I/O that is routed through the FPGA regular routing fabric. In this case, users must instantiate a special macro, PLLINT, to differentiate from the hardwired I/O connection described earlier.

The visual CLKDLY configuration in the SmartGen part of the Libero SoC and Designer tools allows the user to select the desired amount of delay and configures the delay elements appropriately. SmartGen also allows the user to select the input clock source. SmartGen will automatically instantiate the special macro, PLLINT, when needed.

RAM512X18 Description

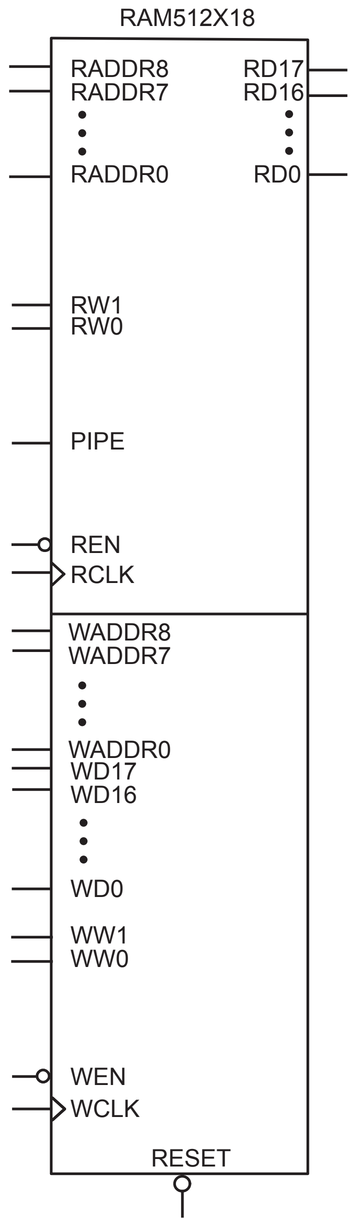

Figure 2-49 **• RAM512X18**

Modes of Operation

There are two read modes and one write mode:

- Read Nonpipelined (synchronous—1 clock edge): In the standard read mode, new data is driven onto the RD bus in the same clock cycle following RA and REN valid. The read address is registered on the read port clock active edge, and data appears at RD after the RAM access time. Setting PIPE to OFF enables this mode.
- Read Pipelined (synchronous—2 clock edges): The pipelined mode incurs an additional clock delay from the address to the data but enables operation at a much higher frequency. The read address is registered on the read port active clock edge, and the read data is registered and appears at RD after the second read clock edge. Setting PIPE to ON enables this mode.
- Write (synchronous—1 clock edge): On the write clock active edge, the write data is written into the SRAM at the write address when WEN is High. The setup times of the write address, write enables, and write data are minimal with respect to the write clock. Write and read transfers are described with timing requirements in the "SRAM Characteristics" section on page 2-63 and the "FIFO Characteristics" section on page 2-72.

RAM Initialization

Each SRAM block can be individually initialized on power-up by means of the JTAG port using the UJTAG mechanism (refer to the "JTAG IEEE 1532" section on page 2-229 and the *Fusion SRAM/FIFO Blocks* application note). The shift register for a target block can be selected and loaded with the proper bit configuration to enable serial loading. The 4,608 bits of data can be loaded in a single operation.

FIFO4K18 Description

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

ADC Description

The Fusion ADC is a 12-bit SAR ADC. It offers a wide variety of features for different use models. Figure 2-80 shows a block diagram of the Fusion ADC.

- Configurable resolution: 8-bit, 10-bit, and 12-bit mode
- DNL: 0.6 LSB for 10-bit mode
- INL: 0.4 LSB for 10-bit mode
- No missing code
- Internal VAREF = 2.56 V
- Maximum Sample Rate = 600 Ksps
- Power-up calibration and dynamic calibration after every sample to compensate for temperature drift over time

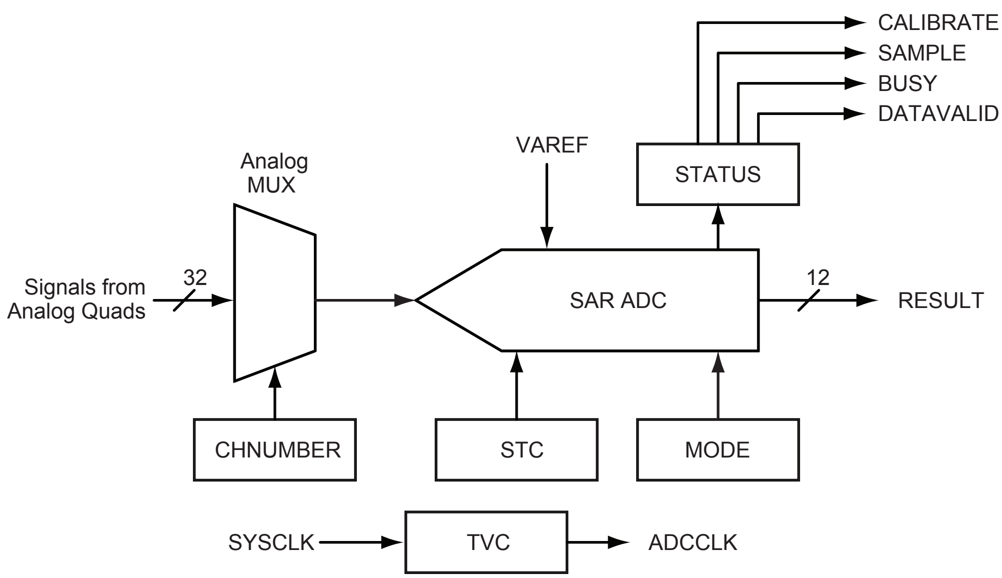

Figure 2-80 **• ADC Simplified Block Diagram**

ADC Theory of Operation

An analog-to-digital converter is used to capture discrete samples of a continuous analog voltage and provide a discrete binary representation of the signal. Analog-to-digital converters are generally characterized in three ways:

- Input voltage range
- Resolution
- Bandwidth or conversion rate

The input voltage range of an ADC is determined by its reference voltage (VREF). Fusion devices include an internal 2.56 V reference, or the user can supply an external reference of up to 3.3 V. The following examples use the internal 2.56 V reference, so the full-scale input range of the ADC is 0 to 2.56 V.

The resolution (LSB) of the ADC is a function of the number of binary bits in the converter. The ADC approximates the value of the input voltage using 2n steps, where n is the number of bits in the converter. Each step therefore represents VREF÷ 2n volts. In the case of the Fusion ADC configured for 12-bit operation, the LSB is 2.56 V / 4096 = 0.625 mV.

Finally, bandwidth is an indication of the maximum number of conversions the ADC can perform each second. The bandwidth of an ADC is constrained by its architecture and several key performance characteristics.

Table 2-50 • ADC Characteristics in Direct Input Mode (continued)
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise),
Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units
Dynamic Performance						
SNR	Signal-to-Noise Ratio	8-bit mode	48.0	49.5		dB
		10-bit mode	58.0	60.0		dB
		12-bit mode	62.9	64.5		dB
SINAD	Signal-to-Noise Distortion	8-bit mode	47.6	49.5		dB
		10-bit mode	57.4	59.8		dB
		12-bit mode	62.0	64.2		dB
THD	Total Harmonic Distortion	8-bit mode		–74.4	–63.0	dBc
		10-bit mode		–78.3	–63.0	dBc
		12-bit mode		–77.9	–64.4	dBc
ENOB	Effective Number of Bits	8-bit mode	7.6	7.9		bits
		10-bit mode	9.5	9.6		bits
		12-bit mode	10.0	10.4		bits
Conversion Rate						
	Conversion Time	8-bit mode	1.7			µs
		10-bit mode	1.8			µs
		12-bit mode	2			µs
	Sample Rate	8-bit mode			600	Ksps
		10-bit mode			550	Ksps
		12-bit mode			500	Ksps

Notes:

1. *Accuracy of the external reference is 2.56 V ± 4.6 mV.*
2. *Data is based on characterization.*
3. *The sample rate is time-shared among active analog inputs.*

Selectable Skew between Output Buffer Enable/Disable Time

The configurable skew block is used to delay the output buffer assertion (enable) without affecting deassertion (disable) time.

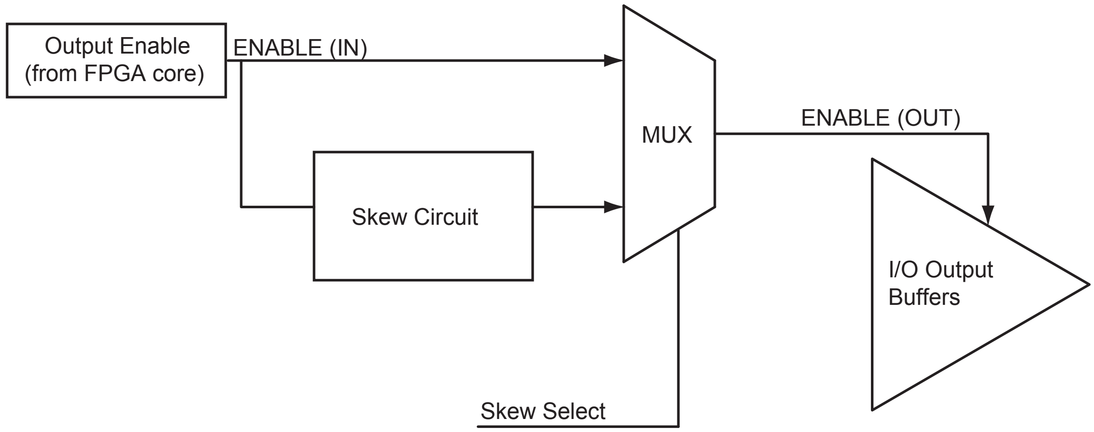

Figure 2-107 **• Block Diagram of Output Enable Path**

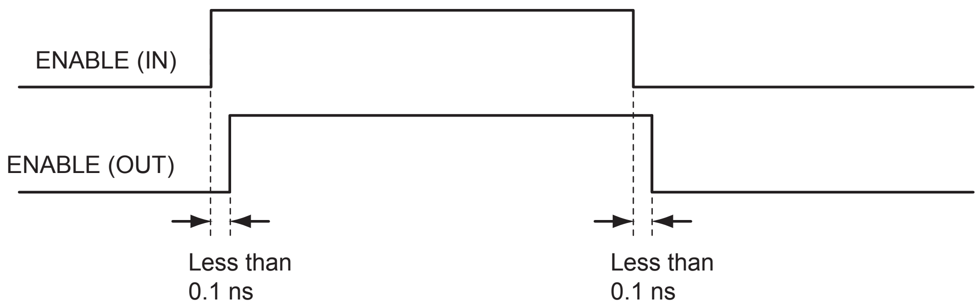

Figure 2-108 **• Timing Diagram (option1: bypasses skew circuit)**

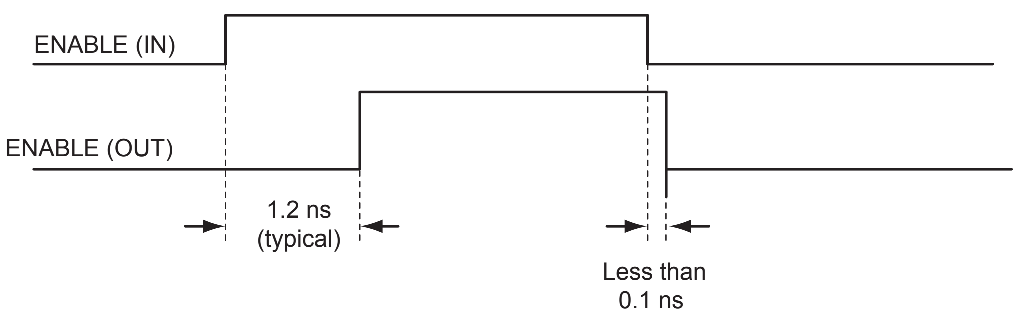

Figure 2-109 **• Timing Diagram (option 2: enables skew circuit)**

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. The 3.3 V LVCMOS standard is supported as part of the 3.3 V LVTTL support.

Std.	0.66	2.06	0.04	1.59	0.43	2.09	2.06			4.33	4.29	ns
–1	0.56	1.75	0.04	1.35	0.36	1.78	1.75			3.68	3.65	ns
–2	0.49	1.53	0.03	1.19	0.32	1.56	1.53			3.23	3.20	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

Theta-JA

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in actual performance of the product. It should be used with caution but is useful for comparing the thermal performance of one package to another.

A sample calculation showing the maximum power dissipation allowed for the AFS600-FG484 package under forced convection of 1.0 m/s and 75°C ambient temperature is as follows:

$$\text{Maximum Power Allowed} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

EQ 4

where

θ_{JA} = 19.00°C/W (taken from Table 3-6 on page 3-7).

T_A = 75.00°C

$$\text{Maximum Power Allowed} = \frac{100.00°C - 75.00°C}{19.00°C/W} = 1.3\ W$$

EQ 5

The power consumption of a device can be calculated using the Microsemi power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package. If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink can be attached on top of the case, or the airflow inside the system must be increased.

Theta-JB

Junction-to-board thermal resistance (θ_{JB}) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal resistance from junction to board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5.0 mm away from the package edge.

Theta-JC

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable for packages used with external heat sinks. Constant temperature is applied to the surface in consideration and acts as a boundary condition. This only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration.

Calculation for Heat Sink

For example, in a design implemented in an AFS600-FG484 package with 2.5 m/s airflow, the power consumption value using the power calculator is 3.00 W. The user-dependent T_a and T_j are given as follows:

T_J = 100.00°C

T_A = 70.00°C

From the datasheet:

θ_{JA} = 17.00°C/W

θ_{JC} = 8.28°C/W

$$P = \frac{T_J - T_A}{\theta_{JA}} = \frac{100°C - 70°C}{17.00\ W} = 1.76\ W$$

3.3 V PCI-X	10	3.3	–	201.02

Notes:

1. *Dynamic power consumption is given for standard load and software-default drive strength and output slew.*
2. *PDC8 is the static power (where applicable) measured on VCCI.*
3. *PAC10 is the total dynamic power measured on VCC and VCCI.*

Total Static Power Consumption—P_{STAT}

Number of Quads used: $N_{QUADS} = 4$

Number of NVM blocks available (AFS600): $N_{NVM\text{-}BLOCKS} = 2$

Number of input pins used: $N_{INPUTS} = 30$

Number of output pins used: $N_{OUTPUTS} = 40$

Operating Mode

$P_{STAT} = PDC1 + (N_{NVM\text{-}BLOCKS} * PDC4) + PDC5 + (N_{QUADS} * PDC6) + (N_{INPUTS} * PDC7) + (N_{OUTPUTS} * PDC8)$

P_{STAT} = 7.50 mW + (2 * 1.19 mW) + 8.25 mW + (4 * 3.30 mW) + (30 * 0.00) + (40 * 0.00)

P_{STAT} = 31.33 mW

Standby Mode

$P_{STAT} = PDC2$

P_{STAT} = 0.03 mW

Sleep Mode

$P_{STAT} = PDC3$

P_{STAT} = 0.03 mW

Total Power Consumption—P_{TOTAL}

In operating mode, the total power consumption of the device is 174.39 mW:

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{TOTAL} = 143.06 mW + 31.33 mW

P_{TOTAL} = 174.39 mW

In standby mode, the total power consumption of the device is limited to 0.66 mW:

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{TOTAL} = 0.03 mW + 0.63 mW

P_{TOTAL} = 0.66 mW

In sleep mode, the total power consumption of the device drops as low as 0.03 mW:

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{TOTAL} = 0.03 mW
