Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	36864
Number of I/O	93
Number of Gates	250000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/afs250-pqg208i

Advanced Architecture

The proprietary Fusion architecture provides granularity comparable to standard-cell ASICs. The Fusion device consists of several distinct and programmable architectural features, including the following (Figure 1-1 on page 1-5):

- Embedded memories
  - Flash memory blocks
  - FlashROM
  - SRAM and FIFO
- Clocking resources
  - PLL and CCC
  - RC oscillator
  - Crystal oscillator
  - No-Glitch MUX (NGMUX)
- Digital I/Os with advanced I/O standards
- FPGA VersaTiles
- Analog components
  - ADC
  - Analog I/Os supporting voltage, current, and temperature monitoring
  - 1.5 V on-board voltage regulator
  - Real-time counter

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic lookup table (LUT) equivalent or a D-flip-flop or latch (with or without enable) by programming the appropriate flash switch interconnections. This versatility allows efficient use of the FPGA fabric. The VersaTile capability is unique to the Microsemi families of flash-based FPGAs. VersaTiles and larger functions are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

In addition, extensive on-chip programming circuitry allows for rapid (3.3 V) single-voltage programming of Fusion devices via an IEEE 1532 JTAG interface.

Unprecedented Integration

Integrated Analog Blocks and Analog I/Os

Fusion devices offer robust and flexible analog mixed signal capability in addition to the high-performance flash FPGA fabric and flash memory block. The many built-in analog peripherals include a configurable 32:1 input analog MUX, up to 10 independent MOSFET gate driver outputs, and a configurable ADC. The ADC supports 8-, 10-, and 12-bit modes of operation with a cumulative sample rate up to 600 k samples per second (Ksps), differential nonlinearity (DNL) < 1.0 LSB, and Total Unadjusted Error (TUE) of 0.72 LSB in 10-bit mode. The TUE is used for characterization of the conversion error and includes errors from all sources, such as offset and linearity. Internal bandgap circuitry offers 1% voltage reference accuracy with the flexibility of utilizing an external reference voltage. The ADC channel sampling sequence and sampling rate are programmable and implemented in the FPGA logic using Designer and Libero SoC software tool support.

Two channels of the 32-channel ADCMUX are dedicated. Channel 0 is connected internally to VCC and can be used to monitor core power supply. Channel 31 is connected to an internal temperature diode which can be used to monitor device temperature. The 30 remaining channels can be connected to external analog signals. The exact number of I/Os available for external connection signals is device-dependent (refer to the "Fusion Family" table on page I for details).

The system application, Level 3, is the larger user application that utilizes one or more applets. Designing at the highest level of abstraction supported by the Fusion technology stack, the application can be easily created in FPGA gates by importing and configuring multiple applets.

In fact, in some cases an entire FPGA system design can be created without any HDL coding.

An optional MCU enables a combination of software and HDL-based design methodologies. The MCU can be on-chip or off-chip as system requirements dictate. System portioning is very flexible, allowing the MCU to reside above the applets or to absorb applets, or applets and backbone, if desired.

The Fusion technology stack enables a very flexible design environment. Users can engage in design across a continuum of abstraction from very low to very high.

Core Architecture

VersaTile

Based upon successful ProASIC3/E logic architecture, Fusion devices provide granularity comparable to gate arrays. The Fusion device core consists of a sea-of-VersaTiles architecture.

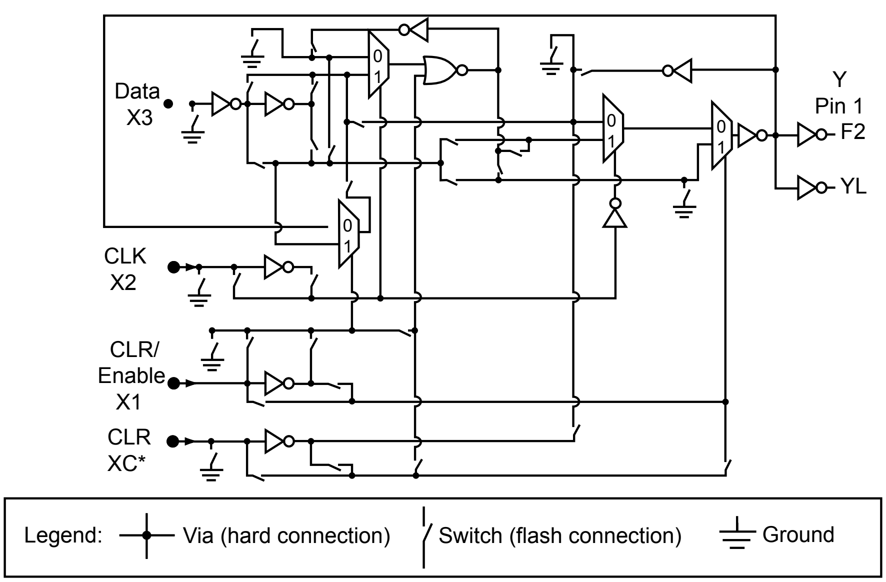
As illustrated in Figure 2-2, there are four inputs in a logic VersaTile cell, and each VersaTile can be configured using the appropriate flash switch connections:

- Any 3-input logic function
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set (on a 4th input)

VersaTiles can flexibly map the logic and sequential gates of a design. The inputs of the VersaTile can be inverted (allowing bubble pushing), and the output of the tile can connect to high-speed, very-long-line routing resources. VersaTiles and larger functions are connected with any of the four levels of routing hierarchy.

When the VersaTile is used as an enable D-flip-flop, the SET/CLR signal is supported by a fourth input, which can only be routed to the core cell over the VersaNet (global) network.

The output of the VersaTile is F2 when the connection is to the ultra-fast local lines, or YL when the connection is to the efficient long-line or very-long-line resources (Figure 2-2).



*Note: *This input can only be connected to the global clock distribution network.*

Figure 2-2 • **Fusion Core VersaTile**

Modes of Operation

Standby Mode

Standby mode allows periodic power-up and power-down of the FPGA fabric. In standby mode, the real-time counter and crystal block are ON. The FPGA is not powered by disabling the 1.5 V voltage regulator. The 1.5 V voltage regulator can be enabled when the preset count is matched. Refer to the "Real-Time Counter (part of AB macro)" section for details. To enter standby mode, the RTC must be first configured and enabled. Then VRPSM is shut off by deasserting the VRPU signal. The 1.5 V voltage regulator is then disabled, and shuts off the 1.5 V output.

Sleep Mode

In sleep mode, the real-time counter and crystal blocks are OFF. The 1.5 V voltage regulator inside the VRPSM can only be enabled by the PUB or TRST pin. Refer to the "Voltage Regulator and Power System Monitor (VRPSM)" section on page 2-36 for details on power-up and power-down of the 1.5 V voltage regulator.

Standby and Sleep Mode Circuit Implementation

For extra power savings, VJTAG and VPUMP should be at the same voltage as VCC, floated or ground, during standby and sleep modes. Note that when VJTAG is not powered, the 1.5 V voltage regulator cannot be enabled through TRST.

VPUMP and VJTAG can be controlled through an external switch. Microsemi recommends ADG839, ADG849, or ADG841 as possible switches. Figure 2-28 shows the implementation for controlling VPUMP. The IN signal of the switch can be connected to PTBASE of the Fusion device. VJTAG can be controlled in same manner.

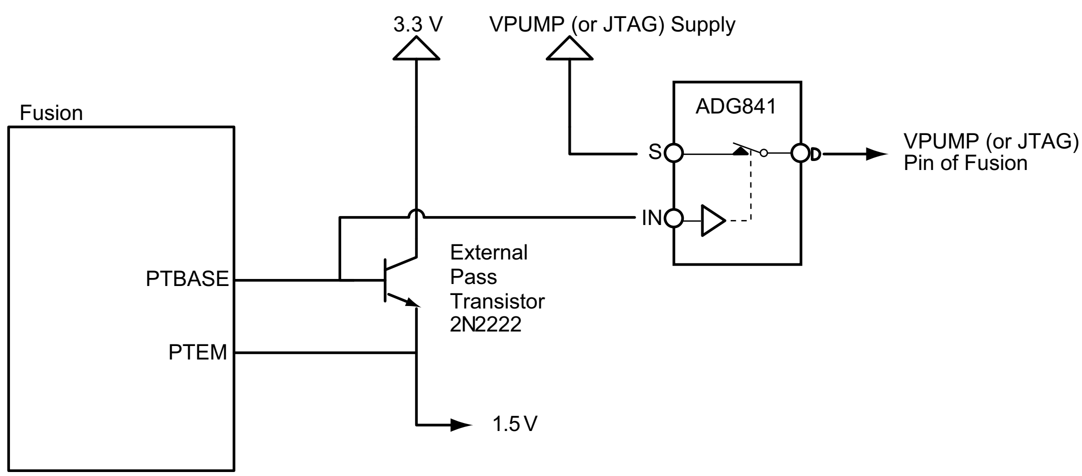


***Figure 2-28* • Implementation to Control VPUMP**

Table 2-19 • **Flash Memory Block Pin Names (continued)**

Interface Name	Width	Direction	Description
STATUS[1:0]	2	Out	Status of the last operation completed: 00: Successful completion 01: Read-/Unprotect-Page: single error detected and corrected Write: operation addressed a write-protected page Erase-Page: protection violation Program: Page Buffer is unmodified Protection violation 10: Read-/Unprotect-Page: two or more errors detected 11: Write: attempt to write to another page before programming current page Erase-Page/Program: page write count has exceeded the 10-year retention threshold
UNPROTECTPAGE	1	In	When asserted, the page addressed is copied into the Page Buffer and the Page Buffer is made writable.
WD[31:0]	32	In	Write data
WEN	1	In	When asserted, stores WD in the page buffer.

All flash memory block input signals are active high, except for RESET.

Flash Memory Block Addressing

Figure 2-34 shows a graphical representation of the flash memory block.

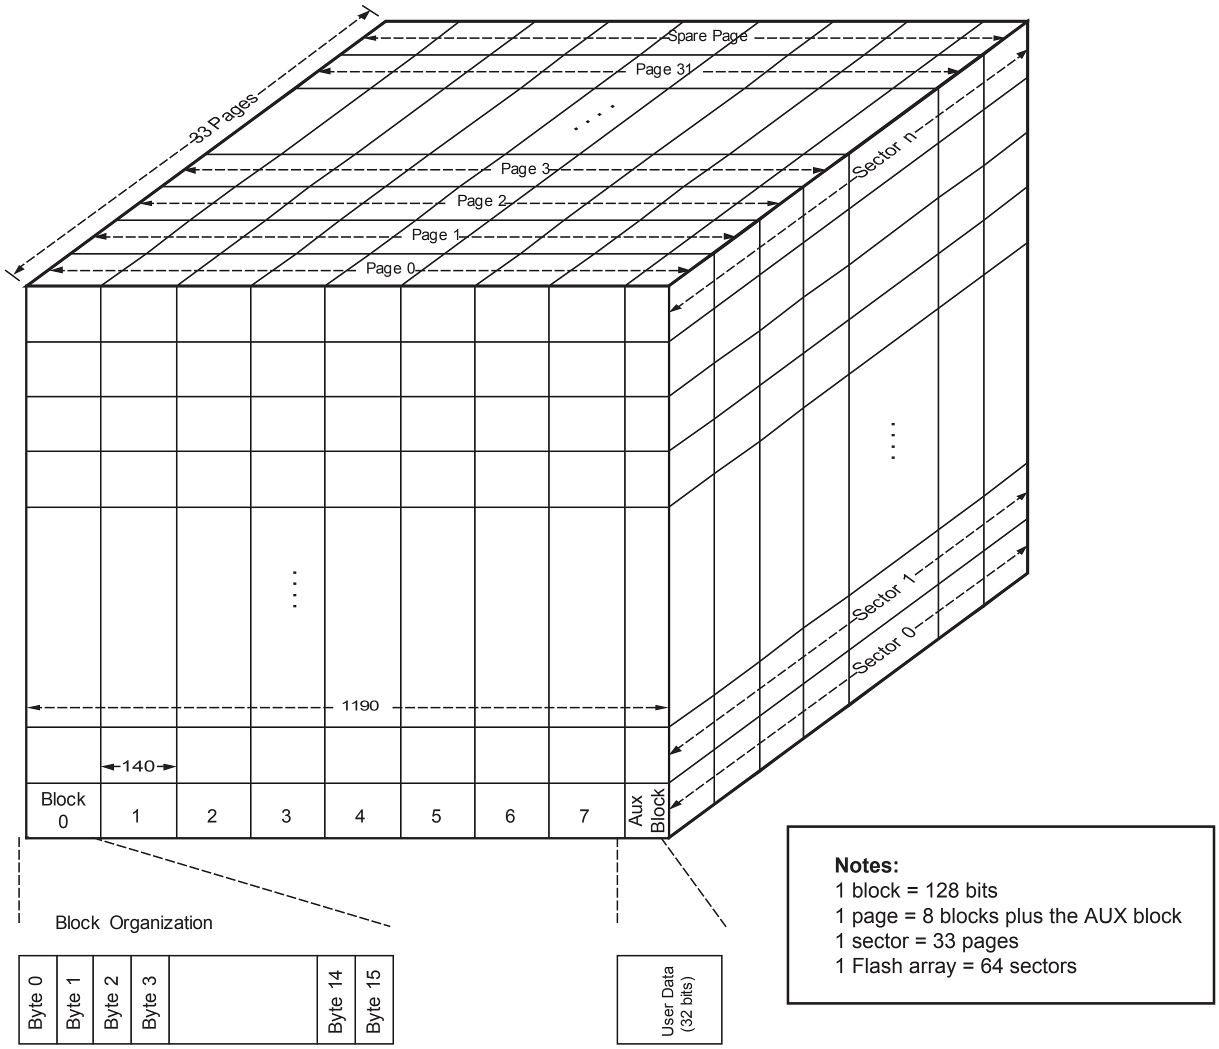

***Figure 2-34* • Flash Memory Block Organization**

Each FB is partitioned into sectors, pages, blocks, and bytes. There are 64 sectors in an FB, and each sector contains 32 pages and 1 spare page. Each page contains 8 data blocks and 1 auxiliary block. Each data block contains 16 bytes of user data, and the auxiliary block contains 4 bytes of user data.

Addressing for the FB is shown in Table 2-20.

***Table 2-20* • FB Address Bit Allocation ADDR[17:0]**

17	12	11	7	6	4	3	0
Sector		Page		Block		Byte	

When the spare page of a sector is addressed (SPAREPAGE active), ADDR[11:7] are ignored.

When the Auxiliary block is addressed (AUXBLOCK active), ADDR[6:2] are ignored.

Note: The spare page of sector 0 is unavailable for any user data. Writes to this page will return an error, and reads will return all zeroes.

Modes of Operation

There are two read modes and one write mode:

- Read Nonpipelined (synchronous—1 clock edge): In the standard read mode, new data is driven onto the RD bus in the same clock cycle following RA and REN valid. The read address is registered on the read port clock active edge, and data appears at RD after the RAM access time. Setting PIPE to OFF enables this mode.
- Read Pipelined (synchronous—2 clock edges): The pipelined mode incurs an additional clock delay from the address to the data but enables operation at a much higher frequency. The read address is registered on the read port active clock edge, and the read data is registered and appears at RD after the second read clock edge. Setting PIPE to ON enables this mode.
- Write (synchronous—1 clock edge): On the write clock active edge, the write data is written into the SRAM at the write address when WEN is High. The setup times of the write address, write enables, and write data are minimal with respect to the write clock. Write and read transfers are described with timing requirements in the "SRAM Characteristics" section on page 2-63 and the "FIFO Characteristics" section on page 2-72.

RAM Initialization

Each SRAM block can be individually initialized on power-up by means of the JTAG port using the UJTAG mechanism (refer to the "JTAG IEEE 1532" section on page 2-229 and the *Fusion SRAM/FIFO Blocks* application note). The shift register for a target block can be selected and loaded with the proper bit configuration to enable serial loading. The 4,608 bits of data can be loaded in a single operation.

Channel Input Offset Error

Channel Offset error is measured as the input voltage that causes the transition from zero to a count of one. An Ideal Prescaler will have offset equal to ½ of LSB voltage. Offset error is a positive or negative when the first transition point is higher or lower than ideal. Offset error is expressed in LSB or input voltage.

Total Channel Error

Total Channel Error is defined as the total error measured compared to the ideal value. Total Channel Error is the sum of gain error and offset error combined. Figure 2-68 shows how Total Channel Error is measured.

Total Channel Error is defined as the difference between the actual ADC output and ideal ADC output. In the example shown in Figure 2-68, the Total Channel Error would be a negative number.

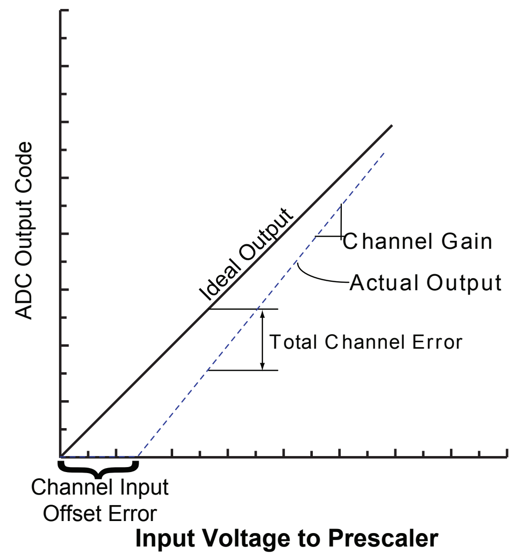

Figure 2-68 **• Total Channel Error Example**

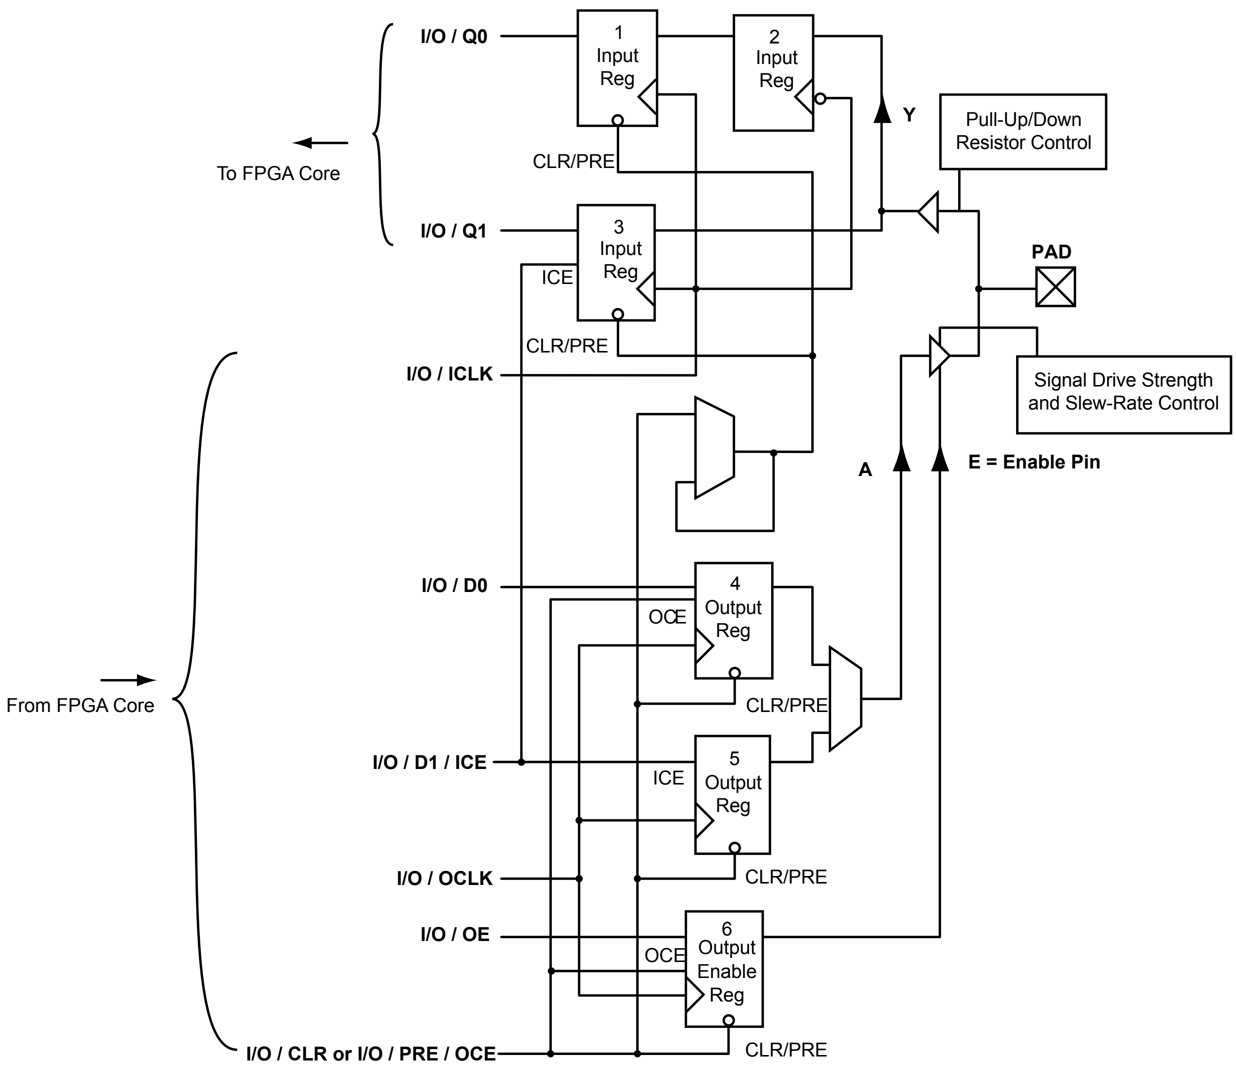
I/O Registers

Each I/O module contains several input, output, and enable registers. Refer to Figure 2-100 for a simplified representation of the I/O block.

The number of input registers is selected by a set of switches (not shown in Figure 2-100) between registers to implement single or differential data transmission to and from the FPGA core. The Designer software sets these switches for the user.

A common CLR/PRE signal is employed by all I/O registers when I/O register combining is used. Input register 2 does not have a CLR/PRE pin, as this register is used for DDR implementation. The I/O register combining must satisfy some rules.



Note: *Fusion I/Os have registers to support DDR functionality (see the "Double Data Rate (DDR) Support" section on page 2-139 for more information).*

Figure 2-100 **• I/O Block Logical Representation**

Table 2-96 • I/O Output Buffer Maximum Resistances [1] (continued)

Standard	Drive Strength	$R_{PULL-DOWN}$ (ohms) [2]	$R_{PULL-UP}$ (ohms) [3]
Applicable to Standard I/O Banks

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-136. The building blocks of the LVPECL transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

User-Defined Supply Pins

VREF I/O Voltage Reference

Reference voltage for I/O minibanks. Both AFS600 and AFS1500 (north bank only) support Microsemi Pro I/O. These I/O banks support voltage reference standard I/O. The VREF pins are configured by the user from regular I/Os, and any I/O in a bank, except JTAG I/Os, can be designated as the voltage reference I/O. Only certain I/O standards require a voltage reference—HSTL (I) and (II), SSTL2 (I) and (II), SSTL3 (I) and (II), and GTL/GTL+. One VREF pin can support the number of I/Os available in its minibank.

VAREF Analog Reference Voltage

The Fusion device can be configured to generate a 2.56 V internal reference voltage that can be used by the ADC. While using the internal reference, the reference voltage is output on the VAREF pin for use as a system reference. If a different reference voltage is required, it can be supplied by an external source and applied to this pin. The valid range of values that can be supplied to the ADC is 1.0 V to 3.3 V. When VAREF is internally generated by the Fusion device, a bypass capacitor must be connected from this pin to ground. The value of the bypass capacitor should be between 3.3 μF and 22 μF, which is based on the needs of the individual designs. The choice of the capacitor value has an impact on the settling time it takes the VAREF signal to reach the required specification of 2.56 V to initiate valid conversions by the ADC. If the lower capacitor value is chosen, the settling time required for VAREF to achieve 2.56 V will be shorter than when selecting the larger capacitor value. The above range of capacitor values supports the accuracy specification of the ADC, which is detailed in the datasheet. Designers choosing the smaller capacitor value will not obtain as much margin in the accuracy as that achieved with a larger capacitor value. Depending on the capacitor value selected in the Analog System Builder, a tool in Libero SoC, an automatic delay circuit will be generated using logic tiles available within the FPGA to ensure that VAREF has achieved the 2.56 V value. Microsemi recommends customers use 10 μF as the value of the bypass capacitor. Designers choosing to use an external VAREF need to ensure that a stable and clean VAREF source is supplied to the VAREF pin before initiating conversions by the ADC. Designers should also make sure that the ADCRESET signal is deasserted before initiating valid conversions.[2]

If the user connects VAREF to external 3.3 V on their board, the internal VAREF driving OpAmp tries to bring the pin down to the nominal 2.56 V until the device is programmed and up/functional. Under this scenario, it is recommended to connect an external 3.3 V supply through a ~1 KOhm resistor to limit current, along with placing a 10-100nF capacitor between VAREF and GNDA.

User Pins

I/O User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected. Unused I/O pins are configured as inputs with pull-up resistors.

During programming, I/Os become tristated and weakly pulled up to VCCI. With the VCCI and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os get instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

A*xy* Analog Input/Output

Analog I/O pin, where *x* is the analog pad type (C = current pad, G = Gate driver pad, T = Temperature pad, V = Voltage pad) and *y* is the Analog Quad number (0 to 9). There is a minimum 1 MΩ to ground on AV, AC, and AT. This pin can be left floating when it is unused.

2. The ADC is functional with an external reference down to 1V, however to meet the performance parameters highlighted in the datasheet refer to the VAREF specification in Table 3-2 on page 3-3.

***Table 3-12* • Summary of I/O Input Buffer Power (per pin)—Default I/O Software Settings (continued)**

	VCCI (V)	Static Power PDC7 (mW)[1]	Dynamic Power PAC9 (μW/MHz)[2]
Applicable to Advanced I/O Banks

Operating Mode

$P_{INPUTS} = N_{INPUTS} * (\alpha_2 / 2) * PAC9 * F_{CLK}$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 3-16 on page 3-27.

F_{CLK} is the global clock signal frequency.

Standby Mode and Sleep Mode

$P_{INPUTS} = 0$ W

I/O Output Buffer Dynamic Contribution—$P_{OUTPUTS}$

Operating Mode

$P_{OUTPUTS} = N_{OUTPUTS} * (\alpha_2 / 2) * \beta_1 * PAC10 * F_{CLK}$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 3-16 on page 3-27.

β_1 is the I/O buffer enable rate—guidelines are provided in Table 3-17 on page 3-27.

F_{CLK} is the global clock signal frequency.

Standby Mode and Sleep Mode

$P_{OUTPUTS} = 0$ W

PQ208

Revision	Changes	Page
Revision 3 (continued)	The "RC Oscillator" section was revised to correct a sentence that did not differentiate accuracy for commercial and industrial temperature ranges, which is given in Table 2-9 • Electrical Characteristics of RC Oscillator (SAR 33722).	2-19
	Figure 2-57 • FIFO Read and Figure 2-58 • FIFO Write are new (SAR 34840).	2-72
	The first paragraph of the "Offset" section was removed; it was intended to be replaced by the paragraph following it (SAR 22647).	2-95
	IOL and IOH values for 3.3 V GTL+ and 2.5 V GTL+ were corrected in Table 2-86 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions (SAR 39813).	2-164
	The drive strength, IOL, and IOH for 3.3 V GTL and 2.5 V GTL were changed from 25 mA to 20 mA in the following tables (SAR 37373): Table 2-86 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions, Table 2-92 • Summary of I/O Timing Characteristics – Software Default Settings Table 2-96 • I/O Output Buffer Maximum Resistances 1 Table 2-138 • Minimum and Maximum DC Input and Output Levels Table 2-141 • Minimum and Maximum DC Input and Output Levels	 2-164 2-167 2-169 2-199 2-200
	The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 34800): "It uses a 5 V–tolerant input buffer and push-pull output buffer."	2-181
	Corrected the inadvertent error in maximum values for LVPECL VIH and VIL and revised them to "3.6" in Table 2-171 • Minimum and Maximum DC Input and Output Levels, making these consistent with Table 3-1 • Absolute Maximum Ratings, and Table 3-4 • Overshoot and Undershoot Limits 1 (SAR 37687).	2-211
	The maximum frequency for global clock parameter was removed from Table 2-5 • AFS1500 Global Resource Timing through Table 2-8 • AFS090 Global Resource Timing because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36955).	2-16 to 2-17
Revision 2 (March 2012)	The phrase "without debug" was removed from the "Soft ARM Cortex-M1 Fusion Devices (M1)" section (SAR 21390).	I
	The "In-System Programming (ISP) and Security" section, "Security" section, "Flash Advantages" section, and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34679).	I, 1-2, 2-228
	The Y security option and Licensed DPA Logo was added to the "Product Ordering Codes" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34721).	III
	The "Specifying I/O States During Programming" section is new (SAR 34693).	1-9
	The following information was added before Figure 2-17 • XTLOSC Macro: In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating (SAR 24119).	2-20
	Table 2-12 • Fusion CCC/PLL Specification was updated. A note was added indicating that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34814).	2-28

Revision	Changes	Page
Advance v0.8 (continued)	This sentence was updated in the "No-Glitch MUX (NGMUX)" section to delete GLA: The GLMUXCFG[1:0] configuration bits determine the source of the CLK inputs (i.e., internal signal or GLC).	2-32
	In Table 2-13 • NGMUX Configuration and Selection Table, 10 and 11 were deleted.	2-32
	The method to enable sleep mode was updated for bit 0 in Table 2-16 • RTC Control/Status Register.	2-38
	S2 was changed to D2 in Figure 2-39 • Read Waveform (Pipe Mode, 32-bit access) for RD[31:0] was updated.	2-51
	The definitions for bits 2 and 3 were updated in Table 2-24 • Page Status Bit Definition.	2-52
	Figure 2-46 • FlashROM Timing Diagram was updated.	2-58
	Table 2-26 • FlashROM Access Time is new.	2-58
	Figure 2-55 • Write Access After Write onto Same Address, Figure 2-56 • Read Access After Write onto Same Address, and Figure 2-57 • Write Access After Read onto Same Address are new.	2-68–2-70
	Table 2-31 • RAM4K9 and Table 2-32 • RAM512X18 were updated.	2-71, 2-72
	The VAREF and SAMPLE functions were updated in Table 2-36 • Analog Block Pin Description.	2-82
	The title of Figure 2-72 • Timing Diagram for Current Monitor Strobe was updated to add the word "positive."	2-91
	The "Gate Driver" section was updated to give information about the switching rate in High Current Drive mode.	2-94
	The "ADC Description" section was updated to include information about the SAMPLE and BUSY signals and the maximum frequencies for SYSCLK and ADCCLK. EQ 2 was updated to add parentheses around the entire expression in the denominator.	2-102
	Table 2-46 · Analog Channel Specifications and Table 2-47 · ADC Characteristics in Direct Input Mode were updated.	2-118, 2-121
	The note was removed from Table 2-55 • Analog Multiplexer Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3).	2-131
	Table 2-63 • Internal Temperature Monitor Control Truth Table is new.	2-132
	The "Cold-Sparing Support" section was updated to add information about cases where current draw can occur.	2-143
	Figure 2-104 • Solution 4 was updated.	2-147
	Table 2-75 • Fusion Standard I/O Standards—OUT_DRIVE Settings was updated.	2-153
	The "GNDA Ground (analog)" section and "GNDAQ Ground (analog quiet)" section were updated to add information about maximum differential voltage.	2-224
	The "V_{AREF} Analog Reference Voltage" section and "VPUMP Programming Supply Voltage" section were updated.	2-226
	The "$V_{CCPLA/B}$ PLL Supply Voltage" section was updated to include information about the east and west PLLs.	2-225
	The V_{COMPLF} pin description was deleted.	N/A
	The "Axy Analog Input/Output" section was updated with information about grounding and floating the pin.	2-226
