Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	36864
Number of I/O	93
Number of Gates	250000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/m1afs250-2pq208

The FlashPoint tool in the Fusion development software solutions, Libero SoC and Designer, has extensive support for flash memory blocks and FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using the Libero SoC and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

Fusion devices have embedded SRAM blocks along the north and south sides of the device. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be written through a 4-bit port and read as a single bitstream. The SRAM blocks can be initialized from the flash memory blocks or via the device JTAG port (ROM emulation mode), using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal EMPTY and FULL flags. The embedded FIFO control unit contains the counters necessary for the generation of the read and write address pointers. The SRAM/FIFO blocks can be cascaded to create larger configurations.

Clock Resources

PLLs and Clock Conditioning Circuits (CCCs)

Fusion devices provide designers with very flexible clock conditioning capabilities. Each member of the Fusion family contains six CCCs. In the two larger family members, two of these CCCs also include a PLL; the smaller devices support one PLL.

The inputs of the CCC blocks are accessible from the FPGA core or from one of several inputs with dedicated CCC block connections.

The CCC block has the following key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz to 350 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz to 350 MHz
- Clock phase adjustment via programmable and fixed delays from –6.275 ns to +8.75 ns
- Clock skew minimization (PLL)
- Clock frequency synthesis (PLL)
- On-chip analog clocking resources usable as inputs:
  - 100 MHz on-chip RC oscillator
  - Crystal oscillator

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°
- Output duty cycle = 50% ± 1.5%
- Low output jitter. Samples of peak-to-peak period jitter when a single global network is used:
  - 70 ps at 350 MHz
  - 90 ps at 100 MHz
  - 180 ps at 24 MHz
  - Worst case < 2.5% × clock period
- Maximum acquisition time = 150 µs
- Low power consumption of 5 mW

VersaTile Characteristics

Sample VersaTile Specifications—Combinatorial Module

The Fusion library offers all combinations of LUT-3 combinatorial functions. In this section, timing characteristics are presented for a sample of the library (Figure 2-3). For more details, refer to the *IGLOO, ProASIC3, SmartFusion, and Fusion Macro Library Guide*.

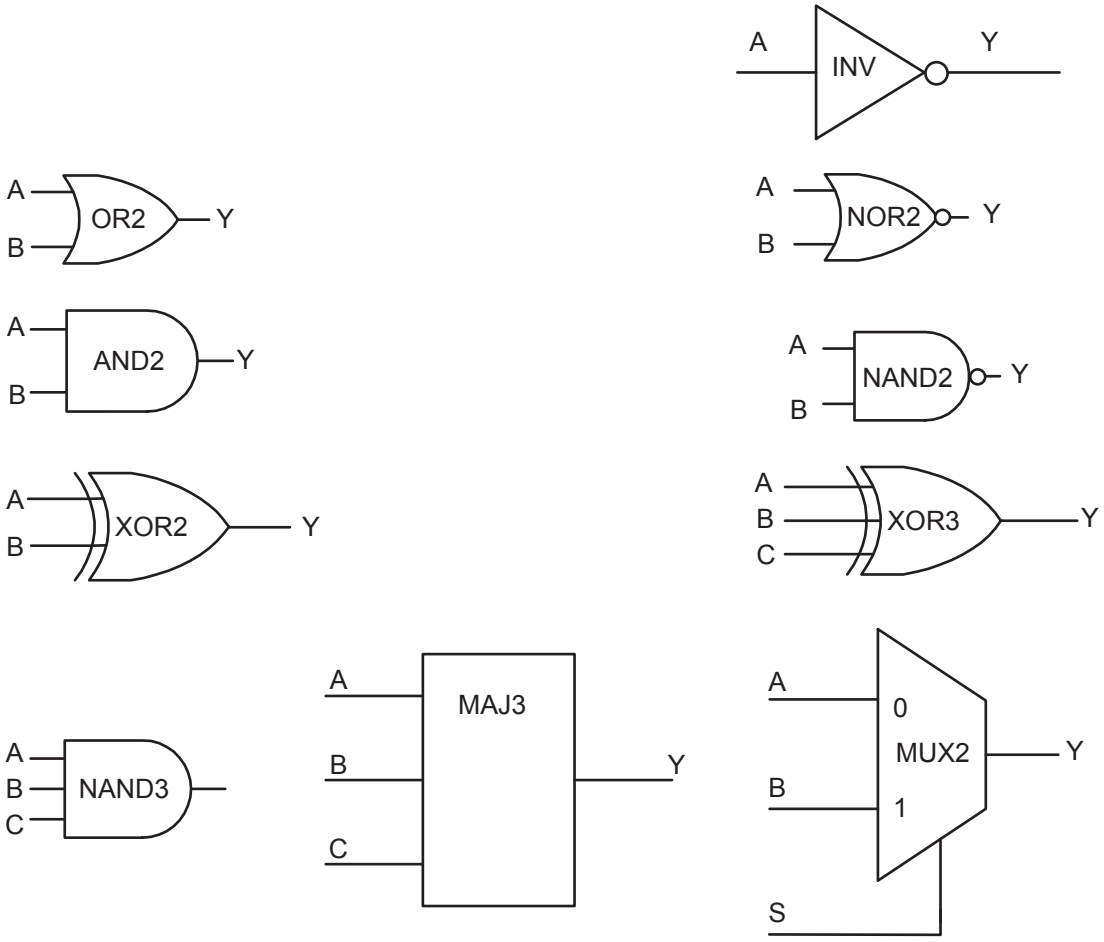

Figure 2-3 • **Sample of Combinatorial Cells**

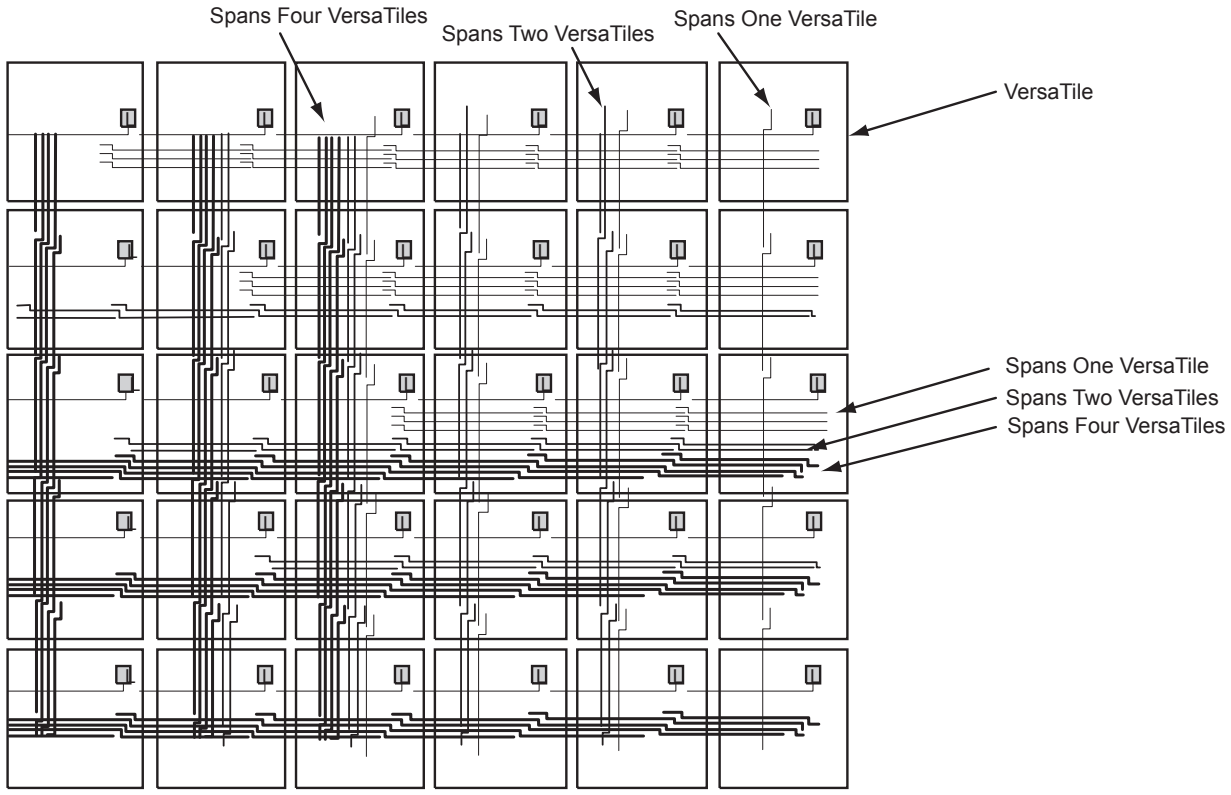

Figure 2-9 • **Efficient Long-Line Resources**

Global Resource Characteristics

AFS600 VersaNet Topology

Clock delays are device-specific. Figure 2-15 is an example of a global tree used for clock routing. The global tree presented in Figure 2-15 is driven by a CCC located on the west side of the AFS600 device. It is used to drive all D-flip-flops in the device.

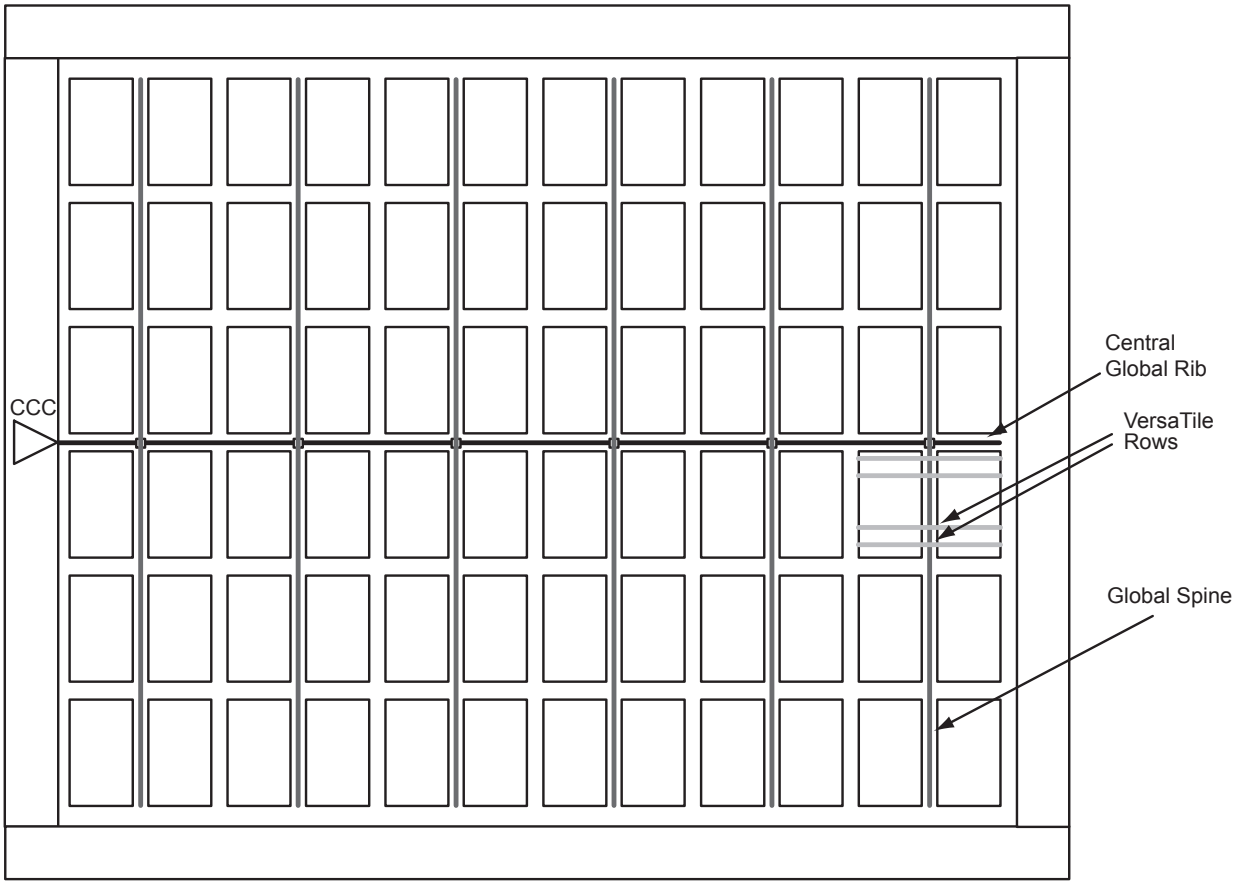

Figure 2-15 • **Example of Global Tree Use in an AFS600 Device for Clock Routing**

SRAM and FIFO

All Fusion devices have SRAM blocks along the north side of the device. Additionally, AFS600 and AFS1500 devices have an SRAM block on the south side of the device. To meet the needs of high-performance designs, the memory blocks operate strictly in synchronous mode for both read and write operations. The read and write clocks are completely independent, and each may operate at any desired frequency less than or equal to 350 MHz. The following configurations are available:

- 4k×1, 2k×2, 1k×4, 512×9 (dual-port RAM—two read, two write or one read, one write)
- 512×9, 256×18 (two-port RAM—one read and one write)
- Sync write, sync pipelined/nonpipelined read

The Fusion SRAM memory block includes dedicated FIFO control logic to generate internal addresses and external flag logic (FULL, EMPTY, AFULL, AEMPTY).

During RAM operation, addresses are sourced by the user logic, and the FIFO controller is ignored. In FIFO mode, the internal addresses are generated by the FIFO controller and routed to the RAM array by internal MUXes. Refer to Figure 2-47 for more information about the implementation of the embedded FIFO controller.

The Fusion architecture enables the read and write sizes of RAMs to be organized independently, allowing for bus conversion. This is done with the WW (write width) and RW (read width) pins. The different D×W configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1. For example, the write size can be set to 256×18 and the read size to 512×9.

Both the write and read widths for the RAM blocks can be specified independently with the WW (write width) and RW (read width) pins. The different D×W configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1.

Refer to the allowable RW and WW values supported for each of the RAM macro types in Table 2-27 on page 2-58.

When a width of one, two, or four is selected, the ninth bit is unused. For example, when writing 9-bit values and reading 4-bit values, only the first four bits and the second four bits of each 9-bit value are addressable for read operations. The ninth bit is not accessible.

Analog-to-Digital Converter Block

At the heart of the Fusion analog system is a programmable Successive Approximation Register (SAR) ADC. The ADC can support 8-, 10-, or 12-bit modes of operation. In 12-bit mode, the ADC can resolve 500 ksps. All results are MSB-justified in the ADC. The input to the ADC is a large 32:1 analog input multiplexer. A simplified block diagram of the Analog Quads, analog input multiplexer, and ADC is shown in Figure 2-79. The ADC offers multiple self-calibrating modes to ensure consistent high performance both at power-up and during runtime.

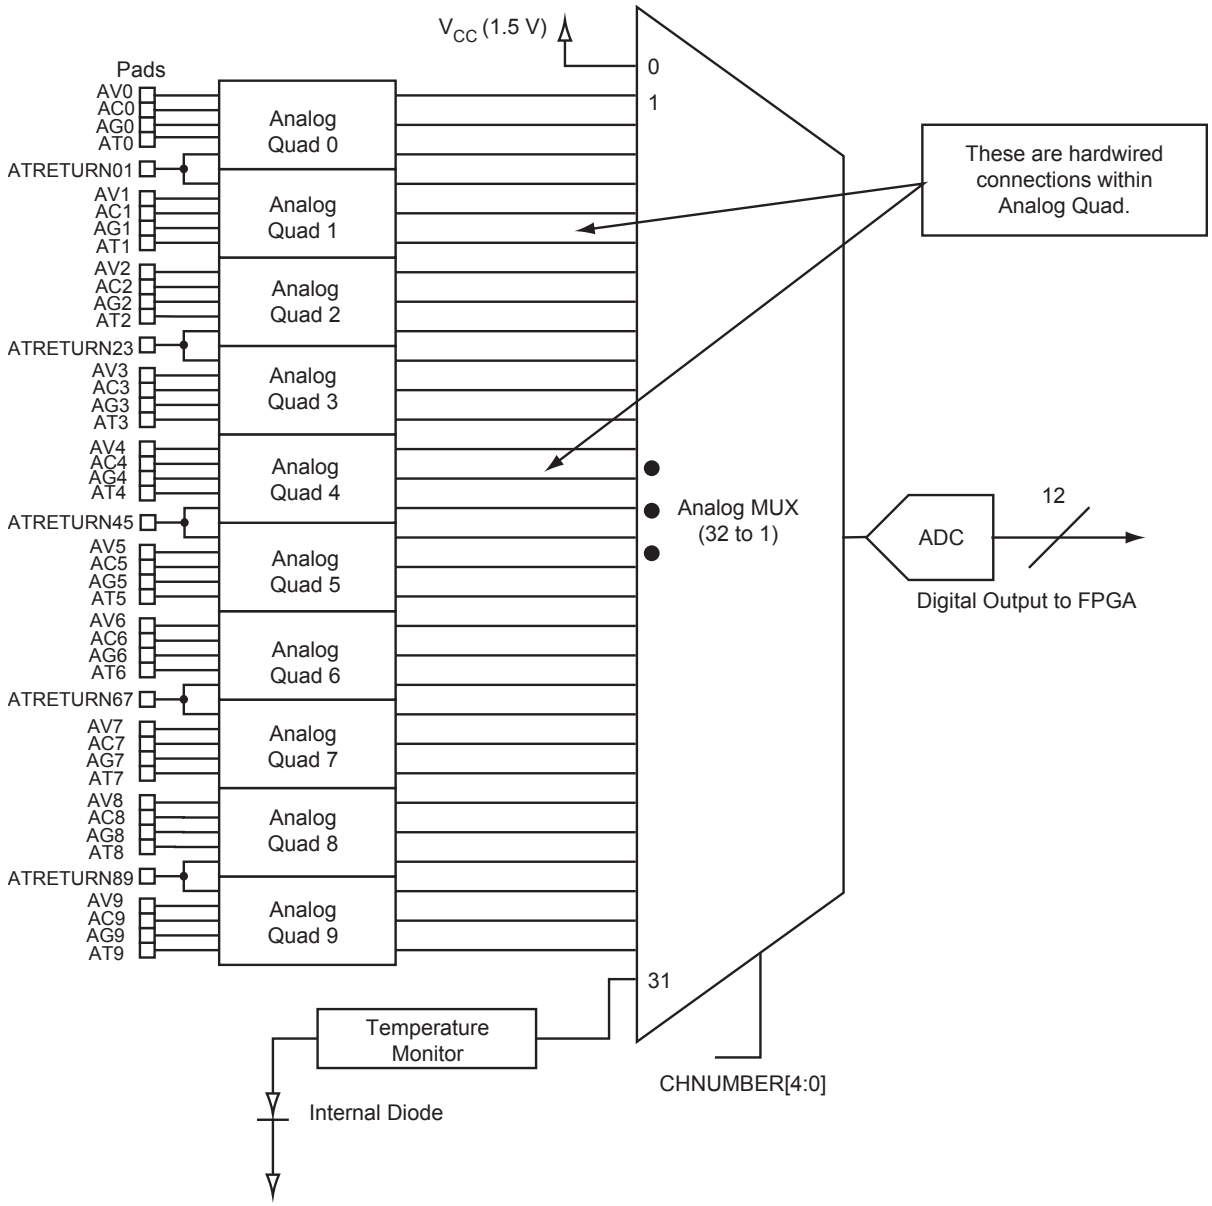

Figure 2-79 • **ADC Block Diagram**

INL – Integral Non-Linearity

INL is the deviation of an actual transfer function from a straight line. After nullifying offset and gain errors, the straight line is either a best-fit straight line or a line drawn between the end points of the transfer function (Figure 2-85).

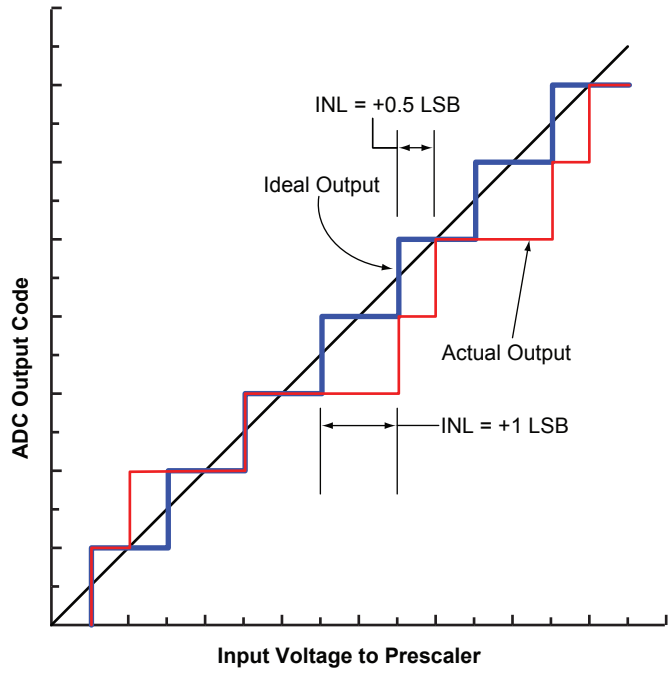

Figure 2-85 • **Integral Non-Linearity (INL)**

LSB – Least Significant Bit

In a binary number, the LSB is the least weighted bit in the group. Typically, the LSB is the furthest right bit. For an ADC, the weight of an LSB equals the full-scale voltage range of the converter divided by 2^N, where N is the converter's resolution.

EQ 13 shows the calculation for a 10-bit ADC with a unipolar full-scale voltage of 2.56 V:

$$1\ \text{LSB} = (2.56\ \text{V} / 2^{10}) = 2.5\ \text{mV}$$

EQ 13

No Missing Codes

An ADC has no missing codes if it produces all possible digital codes in response to a ramp signal applied to the analog input.

Table 2-52 • Calibrated Analog Channel Accuracy [1,2,3]
Worst-Case Industrial Conditions, T_J = 85°C

		Condition	Total Channel Error (LSB)		
Analog Pad	**Prescaler Range (V)**	**Input Voltage[4] (V)**	**Negative Max.**	**Median**	**Positive Max.**
Positive Range			**ADC in 10-Bit Mode**		
AV, AC	16	0.300 to 12.0	–6	1	6
	8	0.250 to 8.00	–6	0	6
	4	0.200 to 4.00	–7	–1	7
	2	0.150 to 2.00	–7	0	7
	1	0.050 to 1.00	–6	–1	6
AT	16	0.300 to 16.0	–5	0	5
	4	0.100 to 4.00	–7	–1	7
Negative Range			**ADC in 10-Bit Mode**		
AV, AC	16	–0.400 to –10.5	–7	1	9
	8	–0.350 to –8.00	–7	–1	7
	4	–0.300 to –4.00	–7	–2	9
	2	–0.250 to –2.00	–7	–2	7
	1	–0.050 to –1.00	–16	–1	20

Notes:

1. *Channel Accuracy includes prescaler and ADC accuracies. For 12-bit mode, multiply the LSB count by 4. For 8-bit mode, divide the LSB count by 4. Overall accuracy remains the same.*
2. *Requires enabling Analog Calibration using SmartGen Analog System Builder. For further details, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.
3. *Calibrated with two-point calibration methodology, using 20% and 80% full-scale points.*
4. *The lower limit of the input voltage is determined by the prescaler input offset.*

Analog Quad ACM Description

Table 2-56 maps out the ACM space associated with configuration of the Analog Quads within the Analog Block. Table 2-56 shows the byte assignment within each quad and the function of each bit within each byte. Subsequent tables will explain each bit setting and how it corresponds to a particular configuration. After 3.3 V and 1.5 V are applied to Fusion, Analog Quad configuration registers are loaded with default settings until the initialization and configuration state machine changes them to user-defined settings.

***Table 2-56* • Analog Quad ACM Byte Assignment**

Byte	Bit	Signal (Bx)	Function	Default Setting
Byte 0 (AV)	0	B0[0]	Scaling factor control – prescaler	Highest voltage range
	1	B0[1]		
	2	B0[2]		
	3	B0[3]	Analog MUX select	Prescaler
	4	B0[4]	Current monitor switch	Off
	5	B0[5]	Direct analog input switch	Off
	6	B0[6]	Selects V-pad polarity	Positive
	7	B0[7]	Prescaler op amp mode	Power-down
Byte 1 (AC)	0	B1[0]	Scaling factor control – prescaler	Highest voltage range
	1	B1[1]		
	2	B1[2]		
	3	B1[3]	Analog MUX select	Prescaler
	4	B1[4]		
	5	B1[5]	Direct analog input switch	Off
	6	B1[6]	Selects C-pad polarity	Positive
	7	B1[7]	Prescaler op amp mode	Power-down
Byte 2 (AG)	0	B2[0]	Internal chip temperature monitor *	Off
	1	B2[1]	Spare	–
	2	B2[2]	Current drive control	Lowest current
	3	B2[3]		
	4	B2[4]	Spare	–
	5	B2[5]	Spare	–
	6	B2[6]	Selects G-pad polarity	Positive
	7	B2[7]	Selects low/high drive	Low drive
Byte 3 (AT)	0	B3[0]	Scaling factor control – prescaler	Highest voltage range
	1	B3[1]		
	2	B3[2]		
	3	B3[3]	Analog MUX select	Prescaler
	4	B3[4]		
	5	B3[5]	Direct analog input switch	Off
	6	B3[6]	–	–
	7	B3[7]	Prescaler op amp mode	Power-down

*Note: *For the internal temperature monitor to function, Bit 0 of Byte 2 for all 10 Quads must be set.*

***Table 2-68* • I/O Bank Support by Device**

I/O Bank	AFS090	AFS250	AFS600	AFS1500
Standard I/O	N	N	–	–
Advanced I/O	E, W	E, W	E, W	E, W
Pro I/O	–	–	N	N
Analog Quad	S	S	S	S

2.5 V GTL

Gunning Transceiver Logic is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 2.5 V.

Table 2-141 • Minimum and Maximum DC Input and Output Levels

2.5 GTL	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
20 mA[3]	–0.3	VREF – 0.05	VREF + 0.05	3.6	0.4	–	20	20	124	169	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*

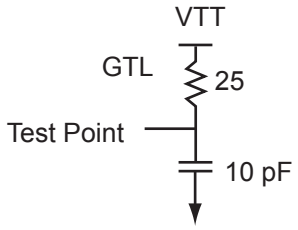

Figure 2-125 • AC Loading

Table 2-142 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C_{LOAD} (pF)
VREF – 0.05	VREF + 0.05	0.8	0.8	1.2	10

*Note: *Measuring point = Vtrip. See Table 2-90 on page 2-166 for a complete table of trip points.*

Timing Characteristics

Table 2-143 • 2.5 V GTL

VCC15A [5]	Digital power supply for the analog system		1.425 to 1.575	1.425 to 1.575	V
VCCNVM	Embedded flash power supply		1.425 to 1.575	1.425 to 1.575	V
VCCOSC	Oscillator power supply		2.97 to 3.63	2.97 to 3.63	V
AV, AC [6]	Unpowered, ADC reset asserted or unconfigured		–10.5 to 12.0	–10.5 to 11.6	V
	Analog input (+16 V to +2 V prescaler range)		–0.3 to 12.0	–0.3 to 11.6	V
	Analog input (+1 V to + 0.125 V prescaler range)		–0.3 to 3.6	–0.3 to 3.6	V
	Analog input (–16 V to –2 V prescaler range)		–10.5 to 0.3	–10.5 to 0.3	V
	Analog input (–1 V to –0.125 V prescaler range)		–3.6 to 0.3	–3.6 to 0.3	V
	Analog input (direct input to ADC)		–0.3 to 3.6	–0.3 to 3.6	V
	Digital input		–0.3 to 12.0	–0.3 to 11.6	V
AG [6]	Unpowered, ADC reset asserted or unconfigured		–10.5 to 12.0	–10.5 to 11.6	V
	Low Current Mode (1 µA, 3 µA, 10 µA, 30 µA)		–0.3 to 12.0	–0.3 to 11.6	V
	Low Current Mode (–1 µA, –3 µA, –10 µA, –30 µA)		–10.5 to 0.3	–10.5 to 0.3	V
	High Current Mode [7]		–10.5 to 12.0	–10.5 to 11.6	V
AT [6]	Unpowered, ADC reset asserted or unconfigured		–0.3 to 15.5	–0.3 to 14.5	V
	Analog input (+16 V, +4 V prescaler range)		–0.3 to 15.5	–0.3 to 14.5	V
	Analog input (direct input to ADC)		–0.3 to 3.6	–0.3 to 3.6	V
	Digital input		–0.3 to 15.5	–0.3 to 14.5	V

Notes:

1. *The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-85 on page 2-157.*
2. *All parameters representing voltages are measured with respect to GND unless otherwise specified.*
3. *The programming temperature range supported is $T_{ambient}$ = 0°C to 85°C.*
4. *VPUMP can be left floating during normal operation (not programming mode).*
5. *Violating the V_{CC15A} recommended voltage supply during an embedded flash program cycle can corrupt the page being programmed.*
6. *The input voltage may overshoot by up to 500 mV above the Recommended Maximum (150 mV in Direct mode), provided the duration of the overshoot is less than 50% of the operating lifetime of the device.*
7. *The AG pad should also conform to the limits as specified in Table 2-48 on page 2-114.*

Thermal Characteristics

Introduction

The temperature variable in the Microsemi Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption will cause the chip's junction temperature to be higher than the ambient, case, or board temperatures. EQ 1 through EQ 3 give the relationship between thermal resistance, temperature gradient, and power.

$$\theta_{JA} = \frac{T_J - \theta_A}{P}$$

EQ 1

$$\theta_{JB} = \frac{T_J - T_B}{P}$$

EQ 2

$$\theta_{JC} = \frac{T_J - T_C}{P}$$

EQ 3

where

θ_{JA} = Junction-to-air thermal resistance
θ_{JB} = Junction-to-board thermal resistance
θ_{JC} = Junction-to-case thermal resistance
T_J = Junction temperature
T_A = Ambient temperature
T_B = Board temperature (measured 1.0 mm away from the package edge)
T_C = Case temperature
P = Total power dissipated by the device

Table 3-6 • **Package Thermal Resistance**

Product	θ_{JA}			θ_{JC}	θ_{JB}	Units
	Still Air	1.0 m/s	2.5 m/s			
AFS090-QN108	34.5	30.0	27.7	8.1	16.7	°C/W
AFS090-QN180	33.3	27.6	25.7	9.2	21.2	°C/W
AFS250-QN180	32.2	26.5	24.7	5.7	15.0	°C/W
AFS250-PQ208	42.1	38.4	37	20.5	36.3	°C/W
AFS600-PQ208	23.9	21.3	20.48	6.1	16.5	°C/W
AFS090-FG256	37.7	33.9	32.2	11.5	29.7	°C/W
AFS250-FG256	33.7	30.0	28.3	9.3	24.8	°C/W
AFS600-FG256	28.9	25.2	23.5	6.8	19.9	°C/W
AFS1500-FG256	23.3	19.6	18.0	4.3	14.2	°C/W
AFS600-FG484	21.8	18.2	16.7	7.7	16.8	°C/W
AFS1500-FG484	21.6	16.8	15.2	5.6	14.9	°C/W
AFS1500-FG676	TBD	TBD	TBD	TBD	TBD	°C/W

The 1.76 W power is less than the required 3.00 W. The design therefore requires a heat sink, or the airflow where the device is mounted should be increased. The design's total junction-to-air thermal resistance requirement can be estimated by EQ 7:

$$\theta_{ja(total)} = \frac{T_J - T_A}{P} = \frac{100°C - 70°C}{3.00\ W} = 10.00°C/W$$

EQ 7

Determining the heat sink's thermal performance proceeds as follows:

$$\theta_{JA(TOTAL)} = \theta_{JC} + \theta_{CS} + \theta_{SA}$$

EQ 8

where

θ_{JA} = 0.37°C/W

= Thermal resistance of the interface material between the case and the heat sink, usually provided by the thermal interface manufacturer

θ_{SA} = Thermal resistance of the heat sink in °C/W

$$\theta_{SA} = \theta_{JA(TOTAL)} - \theta_{JC} - \theta_{CS}$$

EQ 9

$$\theta_{SA} = 13.33°C/W - 8.28°C/W - 0.37°C/W = 5.01°C/W$$

A heat sink with a thermal resistance of 5.01°C/W or better should be used. Thermal resistance of heat sinks is a function of airflow. The heat sink performance can be significantly improved with increased airflow.

Carefully estimating thermal resistance is important in the long-term reliability of an Microsemi FPGA. Design engineers should always correlate the power consumption of the device with the maximum allowable power dissipation of the package selected for that device.

Note: The junction-to-air and junction-to-board thermal resistances are based on JEDEC standard (JESD-51) and assumptions made in building the model. It may not be realized in actual application and therefore should be used with a degree of caution. Junction-to-case thermal resistance assumes that all power is dissipated through the case.

Temperature and Voltage Derating Factors

Table 3-7 • **Temperature and Voltage Derating Factors for Timing Delays (normalized to T_J = 70°C, Worst-Case VCC = 1.425 V)**

Array Voltage VCC (V)	Junction Temperature (°C)					
	–40°C	**0°C**	**25°C**	**70°C**	**85°C**	**100°C**
1.425	0.88	0.93	0.95	1.00	1.02	1.05
1.500	0.83	0.88	0.90	0.95	0.96	0.99
1.575	0.80	0.85	0.87	0.91	0.93	0.96

Example of Power Calculation

This example considers a shift register with 5,000 storage tiles, including a counter and memory that stores analog information. The shift register is clocked at 50 MHz and stores and reads information from a RAM.

The device used is a commercial AFS600 device operating in typical conditions.

The calculation below uses the power calculation methodology previously presented and shows how to determine the dynamic and static power consumption of resources used in the application.

Also included in the example is the calculation of power consumption in operating, standby, and sleep modes to illustrate the benefit of power-saving modes.

Global Clock Contribution—P_{CLOCK}

F_{CLK} = 50 MHz

Number of sequential VersaTiles: $N_{S\text{-}CELL}$ = 5,000

Estimated number of Spines: N_{SPINES} = 5

Estimated number of Rows: N_{ROW} = 313

Operating Mode

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

$P_{CLOCK} = (0.0128 + 5 * 0.0019 + 313 * 0.00081 + 5{,}000 * 0.00011) * 50$

P_{CLOCK} = 41.28 mW

Standby Mode and Sleep Mode

P_{CLOCK} = 0 W

Logic—Sequential Cells, Combinational Cells, and Routing Net Contributions—$P_{S\text{-}CELL}$, $P_{C\text{-}CELL}$, and P_{NET}

F_{CLK} = 50 MHz

Number of sequential VersaTiles: $N_{S\text{-}CELL}$ = 5,000

Number of combinatorial VersaTiles: $N_{C\text{-}CELL}$ = 6,000

Estimated toggle rate of VersaTile outputs: α_1 = 0.1 (10%)

Operating Mode

$P_{S\text{-}CELL} = N_{S\text{-}CELL} * (P_{AC5} + (\alpha_1 / 2) * PAC6) * F_{CLK}$

$P_{S\text{-}CELL} = 5{,}000 * (0.00007 + (0.1 / 2) * 0.00029) * 50$

$P_{S\text{-}CELL}$ = 21.13 mW

$P_{C\text{-}CELL} = N_{C\text{-}CELL} * (\alpha_1 / 2) * PAC7 * F_{CLK}$

$P_{C\text{-}CELL} = 6{,}000 * (0.1 / 2) * 0.00029 * 50$

$P_{C\text{-}CELL}$ = 4.35 mW

$P_{NET} = (N_{S\text{-}CELL} + N_{C\text{-}CELL}) * (\alpha_1 / 2) * PAC8 * F_{CLK}$

$P_{NET} = (5{,}000 + 6{,}000) * (0.1 / 2) * 0.0007 * 50$

P_{NET} = 19.25 mW

$P_{LOGIC} = P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET}$

P_{LOGIC} = 21.13 mW + 4.35 mW + 19.25 mW

P_{LOGIC} = 44.73 mW

Standby Mode and Sleep Mode

Revision	Changes	Page
v2.0, Revision 1 (July 2009)	The MicroBlade and Fusion datasheets have been combined. Pigeon Point information is new. CoreMP7 support was removed since it is no longer offered. –F was removed from the datasheet since it is no longer offered. The operating temperature was changed from ambient to junction to better reflect actual conditions of operations. Commercial: 0°C to 85°C Industrial: –40°C to 100°C The version number category was changed from Preliminary to Production, which means the datasheet contains information based on final characterization. The version number changed from Preliminary v1.7 to v2.0.	N/A
	The "Integrated Analog Blocks and Analog I/Os" section was updated to include a reference to the "Analog System Characteristics" section in the *Device Architecture* chapter of the datasheet, which includes Table 2-46 • Analog Channel Specifications and specific voltage data.	1-4
	The phrase "Commercial-Case Conditions" in timing table titles was changed to "Commercial Temperature Range Conditions."	N/A
	The "Crystal Oscillator" section was updated significantly. Please review carefully.	2-20
	The "Real-Time Counter (part of AB macro)" section was updated significantly. Please review carefully.	2-33
	There was a typo in Table 2-19 • Flash Memory Block Pin Names for the ERASEPAGE description; it was the same as DISCARDPAGE. As as a result, the ERASEPAGE description was updated.	2-40
	The $t_{FMAXCLKNVM}$ parameter was updated in Table 2-25 • Flash Memory Block Timing.	2-52
	Table 2-31 • RAM4K9 and Table 2-32 • RAM512X18 were updated.	2-66
	In Table 2-36 • Analog Block Pin Description, the Function description for PWRDWN was changed from "Comparator power-down if 1" to "ADC comparator power-down if 1. When asserted, the ADC will stop functioning, and the digital portion of the analog block will continue operating. This may result in invalid status flags from the analog block. Therefore, Microsemi does not recommend asserting the PWRDWN pin."	2-78
	Figure 2-75 • Gate Driver Example was updated.	2-91
	The "ADC Operation" section was updated. Please review carefully.	2-104
	Figure 2-92 • Intra-Conversion Timing Diagram and Figure 2-93 • Injected Conversion Timing Diagram are new.	2-113
	The "Typical Performance Characteristics" section is new.	2-115
	Table 2-49 • Analog Channel Specifications was significantly updated.	2-117
	Table 2-50 • ADC Characteristics in Direct Input Mode was significantly updated.	2-120
	In Table 2-52 • Calibrated Analog Channel Accuracy 1,2,3, note 2 was updated.	2-123
	In Table 2-53 • Analog Channel Accuracy: Monitoring Standard Positive Voltages, note 1 was updated.	2-124
	In Table 2-54 • ACM Address Decode Table for Analog Quad, bit 89 was removed.	2-126
