Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	110592
Number of I/O	95
Number of Gates	600000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/m1afs600-pqg208

1 – Fusion Device Family Overview

Introduction

The Fusion mixed signal FPGA satisfies the demand from system architects for a device that simplifies design and unleashes their creativity. As the world's first mixed signal programmable logic family, Fusion integrates mixed signal analog, flash memory, and FPGA fabric in a monolithic device. Fusion devices enable designers to quickly move from concept to completed design and then deliver feature-rich systems to market. This new technology takes advantage of the unique properties of Microsemi flash-based FPGAs, including a high-isolation, triple-well process and the ability to support high-voltage transistors to meet the demanding requirements of mixed signal system design.

Fusion mixed signal FPGAs bring the benefits of programmable logic to many application areas, including power management, smart battery charging, clock generation and management, and motor control. Until now, these applications have only been implemented with costly and space-consuming discrete analog components or mixed signal ASIC solutions. Fusion mixed signal FPGAs present new capabilities for system development by allowing designers to integrate a wide range of functionality into a single device, while at the same time offering the flexibility of upgrades late in the manufacturing process or after the device is in the field. Fusion devices provide an excellent alternative to costly and time-consuming mixed signal ASIC designs. In addition, when used in conjunction with the ARM Cortex-M1 processor, Fusion technology represents the definitive mixed signal FPGA platform.

Flash-based Fusion devices are Instant On. As soon as system power is applied and within normal operating specifications, Fusion devices are working. Fusion devices have a 128-bit flash-based lock and industry-leading AES decryption, used to secure programmed intellectual property (IP) and configuration data. Fusion devices are the most comprehensive single-chip analog and digital programmable logic solution available today.

To support this new ground-breaking technology, Microsemi has developed a series of major tool innovations to help maximize designer productivity. Implemented as extensions to the popular Microsemi Libero® System-on-Chip (SoC) software, these new tools allow designers to easily instantiate and configure peripherals within a design, establish links between peripherals, create or import building blocks or reference designs, and perform hardware verification. This tool suite will also add comprehensive hardware/software debug capability as well as a suite of utilities to simplify development of embedded soft-processor-based solutions.

General Description

The Fusion family, based on the highly successful ProASIC®3 and ProASIC3E flash FPGA architecture, has been designed as a high-performance, programmable, mixed signal platform. By combining an advanced flash FPGA core with flash memory blocks and analog peripherals, Fusion devices dramatically simplify system design and, as a result, dramatically reduce overall system cost and board space.

The state-of-the-art flash memory technology offers high-density integrated flash memory blocks, enabling savings in cost, power, and board area relative to external flash solutions, while providing increased flexibility and performance. The flash memory blocks and integrated analog peripherals enable true mixed-mode programmable logic designs. Two examples are using an on-chip soft processor to implement a fully functional flash MCU and using high-speed FPGA logic to offer system and power supervisory capabilities. Instant On, and capable of operating from a single 3.3 V supply, the Fusion family is ideally suited for system management and control applications.

The devices in the Fusion family are categorized by FPGA core density. Each family member contains many peripherals, including flash memory blocks, an analog-to-digital-converter (ADC), high-drive outputs, both RC and crystal oscillators, and a real-time counter (RTC). This provides the user with a high level of flexibility and integration to support a wide variety of mixed signal applications. The flash memory block capacity ranges from 2 Mbits to 8 Mbits. The integrated 12-bit ADC supports up to 30 independently configurable input channels.

Embedded Memories

Flash Memory Blocks

The flash memory available in each Fusion device is composed of one to four flash blocks, each 2 Mbits in density. Each block operates independently with a dedicated flash controller and interface. Fusion flash memory blocks combine fast access times (60 ns random access and 10 ns access in Read-Ahead mode) with a configurable 8-, 16-, or 32-bit datapath, enabling high-speed flash operation without wait states. The memory block is organized in pages and sectors. Each page has 128 bytes, with 33 pages comprising one sector and 64 sectors per block. The flash block can support multiple partitions. The only constraint on size is that partition boundaries must coincide with page boundaries. The flexibility and granularity enable many use models and allow added granularity in programming updates.

Fusion devices support two methods of external access to the flash memory blocks. The first method is a serial interface that features a built-in JTAG-compliant port, which allows in-system programmability during user or monitor/test modes. This serial interface supports programming of an AES-encrypted stream. Data protected with security measures can be passed through the JTAG interface, decrypted, and then programmed in the flash block. The second method is a soft parallel interface.

FPGA logic or an on-chip soft microprocessor can access flash memory through the parallel interface. Since the flash parallel interface is implemented in the FPGA fabric, it can potentially be customized to meet special user requirements. For more information, refer to the *CoreCFI Handbook.* The flash memory parallel interface provides configurable byte-wide (×8), word-wide (×16), or dual-word-wide (×32) data-port options. Through the programmable flash parallel interface, the on-chip and off-chip memories can be cascaded for wider or deeper configurations.

The flash memory has built-in security. The user can configure either the entire flash block or the small blocks to protect against unintentional or intrusive attempts to change or destroy the storage contents. Each on-chip flash memory block has a dedicated controller, enabling each block to operate independently.

The flash block logic consists of the following sub-blocks:

- Flash block – Contains all stored data. The flash block contains 64 sectors and each sector contains 33 pages of data.
- Page Buffer – Contains the contents of the current page being modified. A page contains 8 blocks of data.
- Block Buffer – Contains the contents of the last block accessed. A block contains 128 data bits.
- ECC Logic – The flash memory stores error correction information with each block to perform single-bit error correction and double-bit error detection on all data blocks.

User Nonvolatile FlashROM

In addition to the flash blocks, Fusion devices have 1 Kbit of user-accessible, nonvolatile FlashROM on-chip. The FlashROM is organized as 8×128-bit pages. The FlashROM can be used in diverse system applications:

- Internet protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for communications algorithms protected by security
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard IEEE 1532 JTAG programming interface. Pages can be individually programmed (erased and written). On-chip AES decryption can be used selectively over public networks to load data such as security keys stored in the FlashROM for a user design.

The FlashROM can be programmed (erased and written) via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing.

The system application, Level 3, is the larger user application that utilizes one or more applets. Designing at the highest level of abstraction supported by the Fusion technology stack, the application can be easily created in FPGA gates by importing and configuring multiple applets.

In fact, in some cases an entire FPGA system design can be created without any HDL coding.

An optional MCU enables a combination of software and HDL-based design methodologies. The MCU can be on-chip or off-chip as system requirements dictate. System portioning is very flexible, allowing the MCU to reside above the applets or to absorb applets, or applets and backbone, if desired.

The Fusion technology stack enables a very flexible design environment. Users can engage in design across a continuum of abstraction from very low to very high.

Core Architecture

VersaTile

Based upon successful ProASIC3/E logic architecture, Fusion devices provide granularity comparable to gate arrays. The Fusion device core consists of a sea-of-VersaTiles architecture.

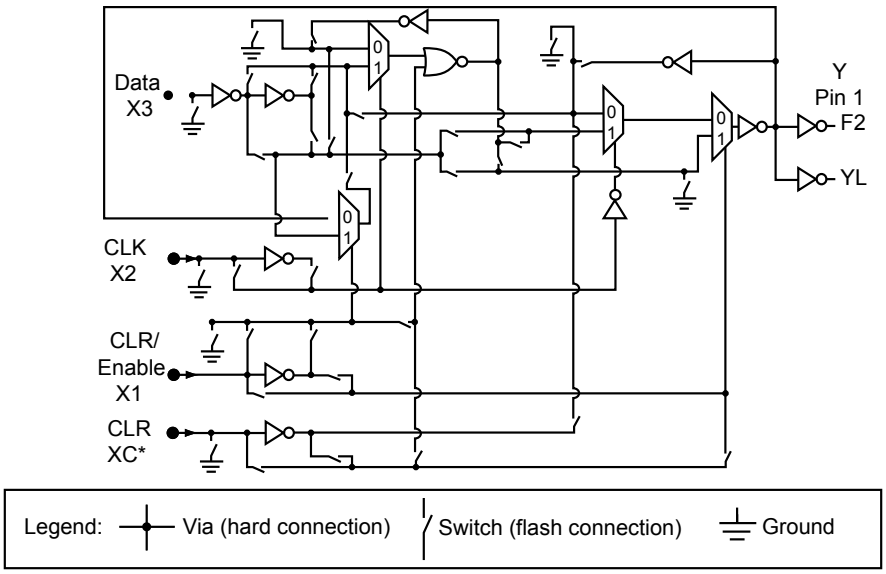
As illustrated in Figure 2-2, there are four inputs in a logic VersaTile cell, and each VersaTile can be configured using the appropriate flash switch connections:

- Any 3-input logic function
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set (on a 4th input)

VersaTiles can flexibly map the logic and sequential gates of a design. The inputs of the VersaTile can be inverted (allowing bubble pushing), and the output of the tile can connect to high-speed, very-long-line routing resources. VersaTiles and larger functions are connected with any of the four levels of routing hierarchy.

When the VersaTile is used as an enable D-flip-flop, the SET/CLR signal is supported by a fourth input, which can only be routed to the core cell over the VersaNet (global) network.

The output of the VersaTile is F2 when the connection is to the ultra-fast local lines, or YL when the connection is to the efficient long-line or very-long-line resources (Figure 2-2).



*Note: *This input can only be connected to the global clock distribution network.*

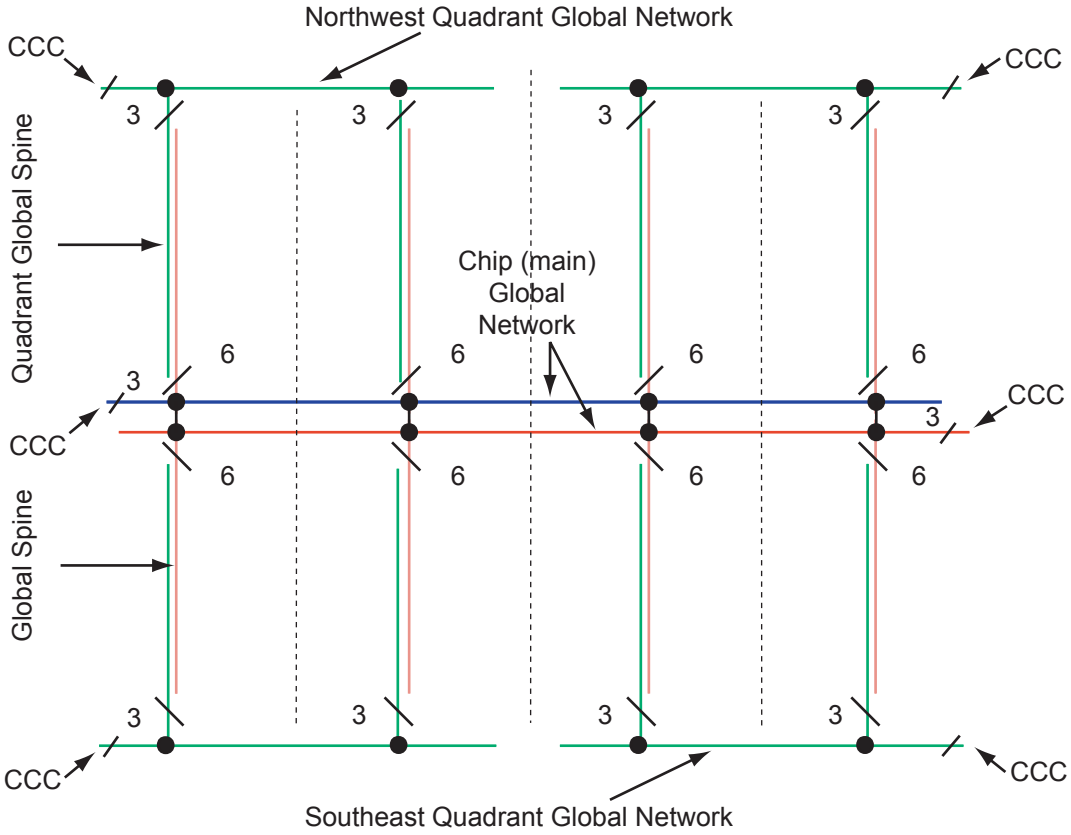

Figure 2-12 • **Global Network Architecture**

Table 2-4 • **Globals/Spines/Rows by Device**

	AFS090	AFS250	AFS600	AFS1500
Global VersaNets (trees)*	9	9	9	9
VersaNet Spines/Tree	4	8	12	20
Total Spines	36	72	108	180
VersaTiles in Each Top or Bottom Spine	384	768	1,152	1,920
Total VersaTiles	2,304	6,144	13,824	38,400

*Note: *There are six chip (main) globals and three globals per quadrant.*

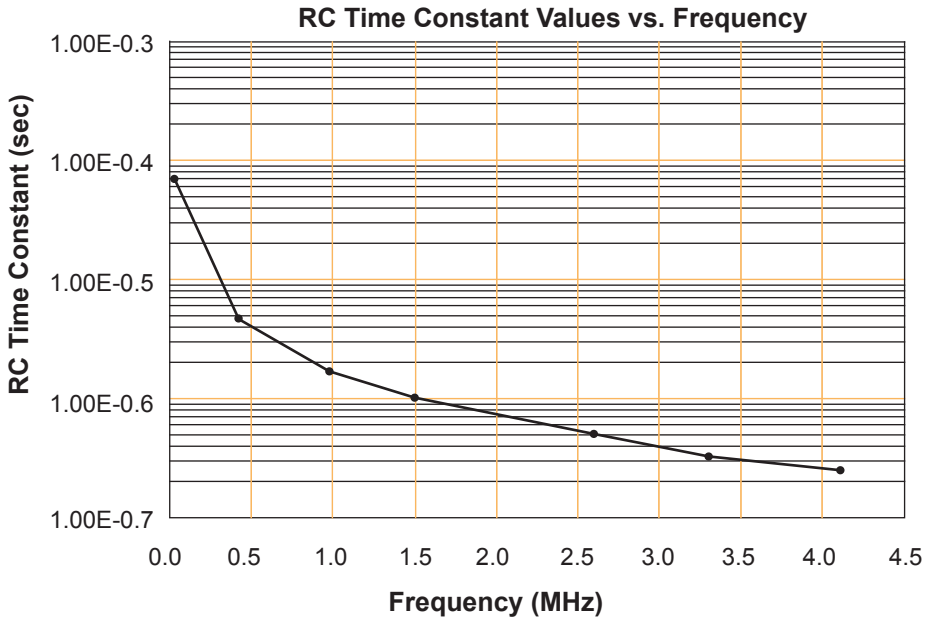

Figure 2-18 • **Crystal Oscillator: RC Time Constant Values vs. Frequency (typical)**

Table 2-10 • **XTLOSC Signals Descriptions**

Signal Name	Width	Direction	Function		
XTL_EN*	1		Enables the crystal. Active high.		
XTL_MODE*	2		Settings for the crystal clock for different frequency.		
			Value	**Modes**	**Frequency Range**
			b'00	RC network	32 KHz to 4 MHz
			b'01	Low gain	32 to 200 KHz
			b'10	Medium gain	0.20 to 2.0 MHz
			b'11	High gain	2.0 to 20.0 MHz
SELMODE	1	IN	Selects the source of XTL_MODE and also enables the XTL_EN. Connect from RTCXTLSEL from AB.		
			0	For normal operation or sleep mode, XTL_EN depends on FPGA_EN, XTL_MODE depends on MODE	
			1	For Standby mode, XTL_EN is enabled, XTL_MODE depends on RTC_MODE	
RTC_MODE[1:0]	2	IN	Settings for the crystal clock for different frequency ranges. XTL_MODE uses RTC_MODE when SELMODE is '1'.		
MODE[1:0]	2	IN	Settings for the crystal clock for different frequency ranges. XTL_MODE uses MODE when SELMODE is '0'. In Standby, MODE inputs will be 0's.		
FPGA_EN*	1	IN	0 when 1.5 V is not present for VCC 1 when 1.5 V is present for VCC		
XTL	1	IN	Crystal Clock source		
CLKOUT	1	OUT	Crystal Clock output		

*Note: *Internal signal—does not exist in macro.*

CCC and PLL Characteristics

Timing Characteristics

Table 2-12 • Fusion CCC/PLL Specification

Parameter		Min.	Typ.	Max.	Unit
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}		1.5		350	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}		0.75		350	MHz
Delay Increments in Programmable Delay Blocks[1, 2]			160[3]		ps
Number of Programmable Values in Each Programmable Delay Block				32	
Input Period Jitter				1.5	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}		Max Peak-to-Peak Period Jitter			
		1 Global Network Used		3 Global Networks Used	
0.75 MHz to 24 MHz		1.00%		1.00%	
24 MHz to 100 MHz		1.50%		1.50%	
100 MHz to 250 MHz		2.25%		2.25%	
250 MHz to 350 MHz		3.50%		3.50%	
Acquisition Time	LockControl = 0			300	µs
	LockControl = 1			6.0	ms
Tracking Jitter[4]	LockControl = 0			1.6	ns
	LockControl = 1			0.8	ns
Output Duty Cycle		48.5		51.5	%
Delay Range in Block: Programmable Delay 1 [1, 2]		0.6		5.56	ns
Delay Range in Block: Programmable Delay 2 [1, 2]		0.025		5.56	ns
Delay Range in Block: Fixed Delay [1, 2]			2.2		ns

Notes:

1. *This delay is a function of voltage and temperature. See Table 3-7 on page 3-9 for deratings.*
2. *T_J = 25°C, VCC = 1.5 V*
3. *When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.*
4. *Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.*

Direct Digital Input

The AV, AC, and AT pads can also be configured as high-voltage digital inputs (Figure 2-69). As these pads are 12 V–tolerant, the digital input can also be up to 12 V. However, the frequency at which these pads can operate is limited to 10 MHz.

To enable one of these analog input pads to operate as a digital input, its corresponding Digital Input Enable (DENA*xy*) pin on the Analog Block must be pulled High, where *x* is either V, C, or T (for AV, AC, or AT pads, respectively) and *y* is in the range 0 to 9, corresponding to the appropriate Analog Quad.

When the pad is configured as a digital input, the signal will come out of the Analog Block macro on the appropriate DA*x*OUT*y* pin, where *x* represents the pad type (V for AV pad, C for AC pad, or T for AT pad) and *y* represents the appropriate Analog Quad number. Example: If the AT pad in Analog Quad 5 is configured as a digital input, it will come out on the DATOUT5 pin of the Analog Block macro.

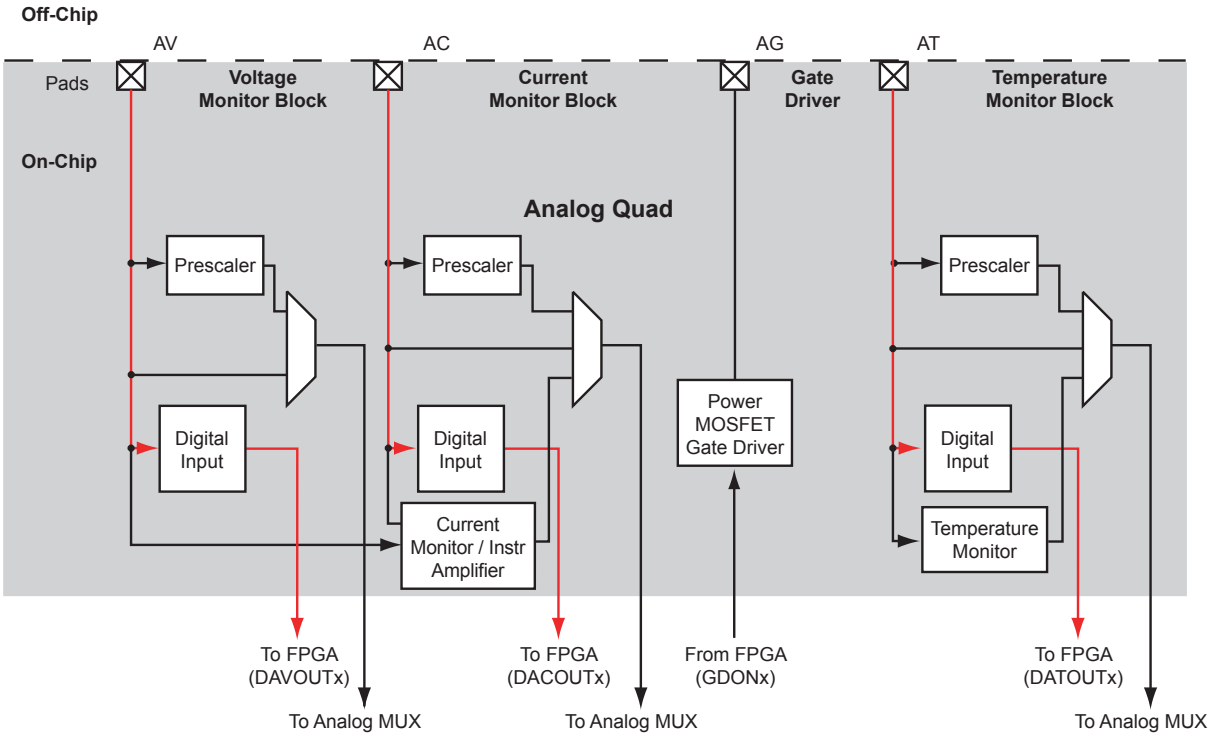

Figure 2-69 • **Analog Quad Direct Digital Input Configuration**

ADC Description

The Fusion ADC is a 12-bit SAR ADC. It offers a wide variety of features for different use models. Figure 2-80 shows a block diagram of the Fusion ADC.

- Configurable resolution: 8-bit, 10-bit, and 12-bit mode
- DNL: 0.6 LSB for 10-bit mode
- INL: 0.4 LSB for 10-bit mode
- No missing code
- Internal VAREF = 2.56 V
- Maximum Sample Rate = 600 Ksps
- Power-up calibration and dynamic calibration after every sample to compensate for temperature drift over time

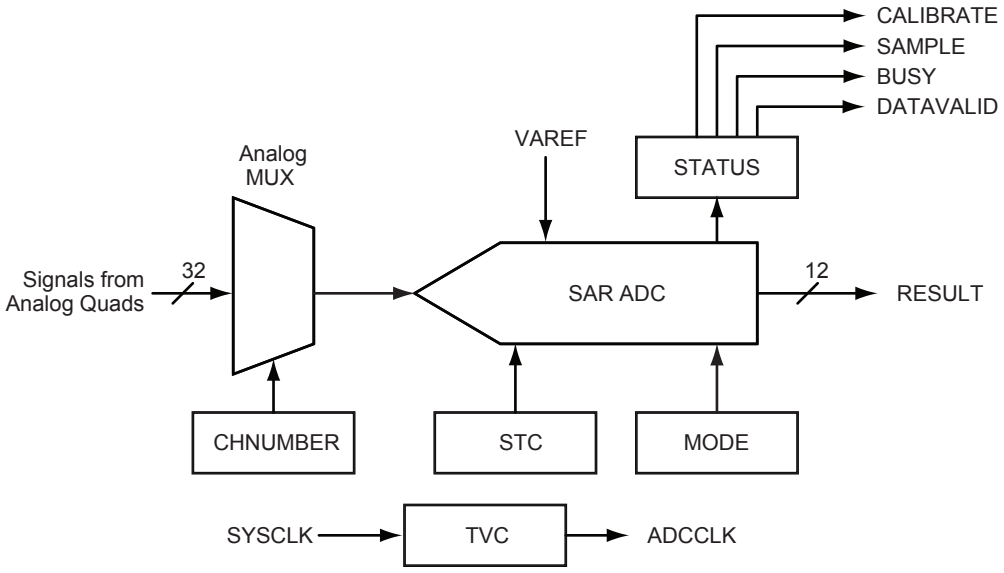

Figure 2-80 • **ADC Simplified Block Diagram**

ADC Theory of Operation

An analog-to-digital converter is used to capture discrete samples of a continuous analog voltage and provide a discrete binary representation of the signal. Analog-to-digital converters are generally characterized in three ways:

- Input voltage range
- Resolution
- Bandwidth or conversion rate

The input voltage range of an ADC is determined by its reference voltage (VREF). Fusion devices include an internal 2.56 V reference, or the user can supply an external reference of up to 3.3 V. The following examples use the internal 2.56 V reference, so the full-scale input range of the ADC is 0 to 2.56 V.

The resolution (LSB) of the ADC is a function of the number of binary bits in the converter. The ADC approximates the value of the input voltage using 2n steps, where n is the number of bits in the converter. Each step therefore represents VREF÷ 2n volts. In the case of the Fusion ADC configured for 12-bit operation, the LSB is 2.56 V / 4096 = 0.625 mV.

Finally, bandwidth is an indication of the maximum number of conversions the ADC can perform each second. The bandwidth of an ADC is constrained by its architecture and several key performance characteristics.

Table 2-49 • Analog Channel Specifications (continued)
Commercial Temperature Range Conditions, T_J = 85°C (unless noted otherwise), Typical: VCC33A = 3.3 V, VCC = 1.5 V

Parameter	Description	Condition	Min.	Typ.	Max.	Units
Temperature Monitor Using Analog Pad AT						
External Temperature Monitor (external diode 2N3904, T_J = 25°C)[4]	Resolution	8-bit ADC		4		°C
		10-bit ADC		1		°C
		12-bit ADC		0.25		°C
	Systematic Offset[5]	AFS090, AFS250, AFS600, AFS1500, uncalibrated[7]		5		°C
		AFS090, AFS250, AFS600, AFS1500, calibrated[7]		±5		°C
	Accuracy			±3	±5	°C
	External Sensor Source Current	High level, TMSTBx = 0		10		µA
		Low level, TMSTBx = 1		100		µA
	Max Capacitance on AT pad				1.3	nF
Internal Temperature Monitor	Resolution	8-bit ADC	4			°C
		10-bit ADC	1			°C
		12-bit ADC	0.25			°C
	Systematic Offset[5]	AFS090[7]		5		°C
		AFS250, AFS600, AFS1500[7]		11		°C
	Accuracy			±3	±5	°C
t_{TMSHI}	Strobe High time		10		105	µs
t_{TMSLO}	Strobe Low time		5			µs
t_{TMSSET}	Settling time		5			µs

Notes:

1. *VRSM is the maximum voltage drop across the current sense resistor.*
2. *Analog inputs used as digital inputs can tolerate the same voltage limits as the corresponding analog pad. There is no reliability concern on digital inputs as long as VIND does not exceed these limits.*
3. *VIND is limited to VCC33A + 0.2 to allow reaching 10 MHz input frequency.*
4. *An averaging of 1,024 samples (LPF setting in Analog System Builder) is required and the maximum capacitance allowed across the AT pins is 500 pF.*
5. *The temperature offset is a fixed positive value.*
6. *The high current mode has a maximum power limit of 20 mW. Appropriate current limit resistors must be used, based on voltage on the pad.*
7. *When using SmartGen Analog System Builder, CalibIP is required to obtain specified offset. For further details on CalibIP, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.

Table 2-53 • Analog Channel Accuracy: Monitoring Standard Positive Voltages Typical Conditions, T_A = 25°C

Input Voltage (V)	Calibrated Typical Error per Positive Prescaler Setting [1] (%FSR)							Direct ADC [2,3] (%FSR)
	16 V (AT)	16 V (12 V) (AV/AC)	8 V (AV/AC)	4 V (AT)	4 V (AV/AC)	2 V (AV/AC)	1 V (AV/AC)	VAREF = 2.56 V
15	1							
14	1							
12	1	1						
5	2	2	1					
3.3	2	2	1	1	1			
2.5	3	2	1	1	1			1
1.8	4	4	1	1	1	1		1
1.5	5	5	2	2	2	1		1
1.2	7	6	2	2	2	1		1
0.9	9	9	4	3	3	1	1	1

Notes:

1. *Requires enabling Analog Calibration using SmartGen Analog System Builder. For further details, refer to the "Temperature, Voltage, and Current Calibration in Fusion FPGAs" chapter of the* Fusion FPGA Fabric User Guide.
2. *Direct ADC mode using an external VAREF of 2.56V±4.6mV, without Analog Calibration macro.*
3. *For input greater than 2.56 V, the ADC output will saturate. A higher VAREF or prescaler usage is recommended.*

Examples

Calculating Accuracy for an Uncalibrated Analog Channel

Formula

For a given prescaler range, EQ 30 gives the output voltage.

$$Output\ Voltage = (Channel\ Output\ Offset\ in\ V) + (Input\ Voltage \times Channel\ Gain) \quad EQ\ 30$$

where

Channel Output offset in V = Channel Input offset in LSBs x Equivalent voltage per LSB

Channel Gain Factor = 1+ (% Channel Gain / 100)

Example

Input Voltage = 5 V

Chosen Prescaler range = 8 V range

Refer to Table 2-51 on page 2-122.

Max. Output Voltage = (Max Positive input offset) + (Input Voltage x Max Positive Channel Gain)

Max. Positive input offset = (21 LSB) x (8 mV per LSB in 10-bit mode)

Max. Positive input offset = 166 mV

Max. Positive Gain Error = +3%

Max. Positive Channel Gain = 1 + (+3% / 100)

Max. Positive Channel Gain = 1.03

Max. Output Voltage = (166 mV) + (5 V x 1.03)

Max. Output Voltage = **5.316 V**

3.3 V PCI/PCI-X	Per PCI/PCI-X specification	25	75

Notes:

1. *These maximum values are provided for informational reasons only. Minimum output buffer resistance values depend on VCC, drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the Microsemi SoC Products Group website: http://www.microsemi.com/soc/techdocs/models/ibis.html.*
2. $R_{(PULL\text{-}DOWN\text{-}MAX)} = VOLspec / I_{OLspec}$
3. $R_{(PULL\text{-}UP\text{-}MAX)} = (VCCImax – VOHspec) / IOHspec$

Table 2-130 • 1.5 V LVCMOS Low Slew

SSTL3 Class I

Stub-Speed Terminated Logic for 3.3 V memory bus standard (JESD8-8). Fusion devices support Class I. This provides a differential amplifier input buffer and a push-pull output buffer.

Table 2-162 • Minimum and Maximum DC Input and Output Levels

SSTL3 Class I	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
14 mA	–0.3	VREF – 0.2	VREF + 0.2	3.6	0.7	VCCI – 1.1	14	14	54	51	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*

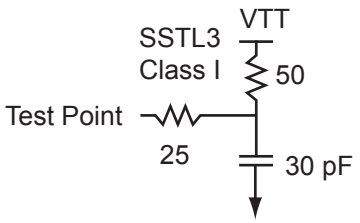

Figure 2-132 • AC Loading

Table 2-163 • AC Waveforms, Measuring Points, and Capacitive Loads

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)	VTT (typ.) (V)	C_{LOAD} (pF)
VREF – 0.2	VREF + 0.2	1.5	1.5	1.485	30

*Note: *Measuring point = Vtrip. See Table 2-90 on page 2-166 for a complete table of trip points.*

Timing Characteristics

Table 2-164 • SSTL3 Class I
Commercial Temperature Range Conditions: T_J = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 3.0 V, VREF = 1.5 V

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	t_{EOUT}	t_{ZL}	t_{ZH}	t_{LZ}	t_{HZ}	t_{ZLS}	t_{ZHS}	Units
Std.	0.66	2.31	0.04	1.25	0.43	2.35	1.84			4.59	4.07	ns
–1	0.56	1.96	0.04	1.06	0.36	2.00	1.56			3.90	3.46	ns
–2	0.49	1.72	0.03	0.93	0.32	1.75	1.37			3.42	3.04	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-136. The building blocks of the LVPECL transmitter–receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

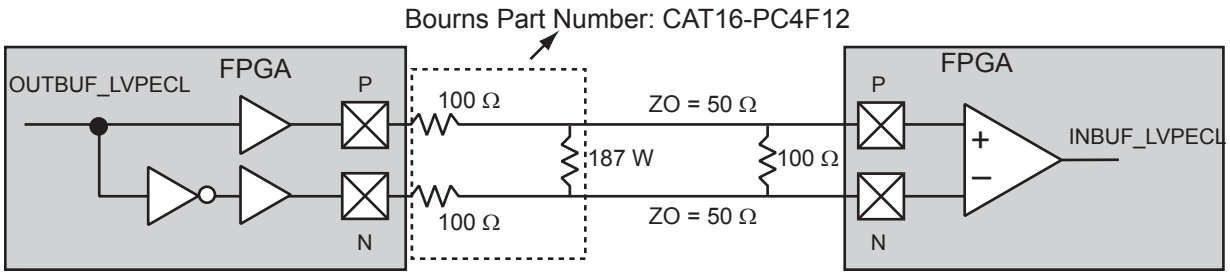

***Figure 2-136* • LVPECL Circuit Diagram and Board-Level Implementation**

***Table 2-171* • Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units
VCCI	Supply Voltage	3.0		3.3		3.6		V
VOL	Output Low Voltage	0.96	1.27	1.06	1.43	1.30	1.57	V
VOH	Output High Voltage	1.8	2.11	1.92	2.28	2.13	2.41	V
VIL, VIH	Input Low, Input High Voltages	0	3.6	0	3.6	0	3.6	V
VODIFF	Differential Output Voltage	0.625	0.97	0.625	0.97	0.625	0.97	V
VOCM	Output Common Mode Voltage	1.762	1.98	1.762	1.98	1.762	1.98	V
VICM	Input Common Mode Voltage	1.01	2.57	1.01	2.57	1.01	2.57	V
VIDIFF	Input Differential Voltage	300		300		300		mV

***Table 2-172* • AC Waveforms, Measuring Points, and Capacitive Loads**

Input Low (V)	Input High (V)	Measuring Point* (V)	VREF (typ.) (V)
1.64	1.94	Cross point	–

*Note: *Measuring point = Vtrip. See Table 2-90 on page 2-166 for a complete table of trip points.*

Timing Characteristics

Speed Grade	t_{DOUT}	t_{DP}	t_{DIN}	t_{PY}	Units
Std.	0.66	2.14	0.04	1.63	ns
–1	0.56	1.82	0.04	1.39	ns
–2	0.49	1.60	0.03	1.22	ns

Note: For the derating values at specific junction temperature and voltage supply levels, refer to Table 3-7 on page 3-9.

TMS **Test Mode Select**

The TMS pin controls the use of the IEEE1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST **Boundary Scan Reset Pin**

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the TAP is held in reset mode. The resistor values must be chosen from Table 2-183 and must satisfy the parallel resistance value requirement. The values in Table 2-183 correspond to the resistor recommended when a single device is used and to the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entering an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements.

Special Function Pins

NC **No Connect**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC **Don't Connect**

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

NCAP **Negative Capacitor**

Negative Capacitor is where the negative terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 µF recommended value, is required to connect between PCAP and NCAP.

PCAP **Positive Capacitor**

Positive Capacitor is where the positive terminal of the charge pump capacitor is connected. A capacitor, with a 2.2 µF recommended value, is required to connect between PCAP and NCAP.

PUB **Push Button**

Push button is the connection for the external momentary switch used to turn on the 1.5 V voltage regulator and can be floating if not used.

PTBASE **Pass Transistor Base**

Pass Transistor Base is the control signal of the voltage regulator. This pin should be connected to the base of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

PTEM **Pass Transistor Emitter**

Pass Transistor Emitter is the feedback input of the voltage regulator.

This pin should be connected to the emitter of the external pass transistor used with the 1.5 V internal voltage regulator and can be floating if not used.

XTAL1 **Crystal Oscillator Circuit Input**

Input to crystal oscillator circuit. Pin for connecting external crystal, ceramic resonator, RC network, or external clock input. When using an external crystal or ceramic oscillator, external capacitors are also recommended (Please refer to the crystal oscillator manufacturer for proper capacitor value).

If using external RC network or clock input, XTAL1 should be used and XTAL2 left unconnected. In the case where the Crystal Oscillator block is not used, the XTAL1 pin should be connected to GND and the XTAL2 pin should be left floating.

5 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each revision of the Fusion datasheet.

Revision	Changes	Page
Revision 6 (March 2014)	Note added for the discontinuance of QN108 and QN180 packages to the "Package I/Os: Single-/Double-Ended (Analog)" table and the "Temperature Grade Offerings" table (SAR 55113, PDN 1306).	II and IV
	Updated details about page programming time in the "Program Operation" section (SAR 49291).	2-46
	ADC_START changed to ADCSTART in the "ADC Operation" section (SAR 44104).	2-104
Revision 5 (January 2014)	Calibrated offset values (AFS090, AFS250) of the external temperature monitor in Table 2-49 • Analog Channel Specifications have been updated (SAR 51464).	2-117
	Specifications for the internal temperature monitor in Table 2-49 • Analog Channel Specifications have been updated (SAR 50870).	2-117
Revision 4 (January 2013)	The "Product Ordering Codes" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43177).	III
	The note in Table 2-12 • Fusion CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42563).	2-28
	Table 2-49 • Analog Channel Specifications was modified to update the uncalibrated offset values (AFS250) of the external and internal temperature monitors (SAR 43134).	2-117
	In Table 2-57 • Prescaler Control Truth Table—AV (x = 0), AC (x = 1), and AT (x = 3), changed the column heading from 'Full-Scale Voltage' to 'Full Scale Voltage in 10-Bit Mode', and added and updated Notes as required (SAR 20812).	2-130
	The values for the Speed Grade (-1 and Std.) for FDDRIMAX (Table 2-180 • Input DDR Propagation Delays) and values for the Speed Grade (-2 and Std.) for FDDOMAX (Table 2-182 • Output DDR Propagation Delays) had been inadvertently interchanged. This has been rectified (SAR 38514).	2-220, 2-222
	Added description about what happens if a user connects VAREF to an external 3.3 V on their board to the "VAREF Analog Reference Voltage" section (SAR 35188).	2-225
	Added a note to Table 3-2 • Recommended Operating Conditions1 (SAR 43429): The programming temperature range supported is $T_{ambient}$ = 0°C to 85°C.	3-3
	Added the Package Thermal details for AFS600-PQ208 and AFS250-PQ208 to Table 3-6 • Package Thermal Resistance (SAR 37816). Deleted the Die Size column from the table (SAR 43503).	3-7
	Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 42495). Live at Power-Up (LAPU) has been replaced with 'Instant On'.	NA
Revision 3 (August 2012)	Microblade U1AFS250 and U1AFS1500 devices were added to the product tables.	I – IV
	A sentence pertaining to the analog I/Os was added to the "Specifying I/O States During Programming" section (SAR 34831).	1-9

Revision	Changes	Page
Advance v1.0 (continued)	This change table states that in the "208-Pin PQFP" table listed under the Advance v0.8 changes, the AFS090 device had a pin change. That is incorrect. Pin 102 was updated for AFS250 and AFS600. The function name changed from $V_{CC33ACAP}$ to V_{CC33A}.	3-8
Advance v0.9 (October 2007)	In the "Package I/Os: Single-/Double-Ended (Analog)" table, the AFS1500/M7AFS1500 I/O counts were updated for the following devices: FG484: 223/109 FG676: 252/126	II
	In the "108-Pin QFN" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pin: B25	3-2
	In the "180-Pin QFN" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: B29 AFS250: B29	3-4
	In the "208-Pin PQFP" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: 102 AFS250: 102	3-8
	In the "256-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS090: T14 AFS250: T14 AFS600: T14 AFS1500: T14	3-12
Advance v0.9 (continued)	In the "484-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS600: AB18 AFS1500: AB18	3-20
	In the "676-Pin FBGA" table, the function changed from $V_{CC33ACAP}$ to V_{CC33A} for the following pins: AFS1500: AD20	3-28
Advance v0.8 (June 2007)	Figure 2-16 • Fusion Clocking Options and the "RC Oscillator" section were updated to change GND_OSC and VCC_OSC to GNDOSC and VCCOSC.	2-20, 2-21
	Figure 2-19 • Fusion CCC Options: Global Buffers with the PLL Macro was updated to change the positions of OADIVRST and OADIVHALF, and a note was added.	2-25
	The "Crystal Oscillator" section was updated to include information about controlling and enabling/disabling the crystal oscillator.	2-22
	Table 2-11 · Electrical Characteristics of the Crystal Oscillator was updated to change the typical value of $I_{DYNXTAL}$ for 0.032–0.2 MHz to 0.19.	2-24
	The "1.5 V Voltage Regulator" section was updated to add "or floating" in the paragraph stating that an external pull-down is required on TRST to power down the VR.	2-41
	The "1.5 V Voltage Regulator" section was updated to include information on powering down with the VR.	2-41
