#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Power Supply Input	VCC VSS	I	Apply 2.7V to 5.5V to the VCC pin. Apply 0V to the VSS pin
Analog Power Supply Input	AVCC AVSS	I	Power supply input pins to A/D converter. Connect AVCC to VCC. Apply 0V to AVSS. Connect a capacitor between AVCC and AVSS.
Reset Input	RESET	I	Input "L" on this pin resets the MCU
MODE	MODE	I	Connect this pin to VCC via a resistor
Main Clock Input	XIN	I	These pins are provided for the main clock
Main Clock Output	XOUT	0	generation circuit I/O. Connect a ceramic resonator or a crystal oscillator between the XIN and XOUT pins. To use an externally derived clock, input it to the XIN pin and leave the XOUT pin open.
INT Interrupt	INTO, INT1, INT3	I	INT interrupt input pins
Key Input Interrupt	KI0 to KI3	I	Key input interrupt input pins
Timer X	CNTR0	I/O	Timer X I/O pin
	CNTR0	0	Timer X output pin.

## 3.2 R8C/15 Group

Figure 3.2 is a Memory Map of R8C/15 Group. The R8C/15 group provides 1-Mbyte address space from addresses 00000h to FFFFh.

The internal ROM (program ROM) is allocated lower addresses beginning with address 0FFFFh. For example, a 16-Kbyte internal ROM is allocated addresses 0C000h to 0FFFFh.

The fixed interrupt vector table is allocated addresses 0FFDCh to 0FFFFh. They store the starting address of each interrupt routine.

The internal ROM (data flash) is allocated addresses 02400h to 02BFFh.

The internal RAM is allocated higher addresses beginning with address 00400h. For example, a 1-Kbyte internal RAM is allocated addresses 00400h to 007FFh. The internal RAM is used not only for storing data but for calling subroutines and stacks when interrupt request is acknowledged.

Special function registers (SFR) are allocated addresses 00000h to 002FFh. The peripheral function control registers are allocated them. All addresses, which have nothing allocated within the SFR, are reserved area and cannot be accessed by users.
