Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	Coldfire V1
Core Size	32-Bit Single-Core
Speed	50MHz
Connectivity	I²C, SCI, SPI
Peripherals	LVD, PWM, WDT
Number of I/O	54
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 20x12b
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mcf51ac256bcpue

1 MCF51AC256 Family Configurations

1.1 Device Comparison

The MCF51AC256 series is summarized in Table 1.

Table 1. MCF51AC256 Series Device Comparison

Feature	MCF51AC256A		MCF51AC256B			MCF51AC128A		MCF51AC128C		
	80-pin	64-pin	80-pin	64-pin	44-pin	80-pin	64-pin	80-pin	64-pin	44-pin
Flash memory size (Kbytes)	256					128				
RAM size (Kbytes)	32					32 or 16[1]				
V1 ColdFire core with BDM (background debug module)	Yes									
ACMP1 (analog comparator)	Yes									
ACMP2 (analog comparator)	Yes		Yes		No	Yes				No
ADC (analog-to-digital converter) channels (12-bit)	24	20	24	20	9	24	20	24	20	9
CAN (controller area network)	Yes		No			Yes		No		
COP (computer operating properly)	Yes									
CRC (cyclic redundancy check)	Yes									
RTI	Yes									
DBG (debug)	Yes									
IIC1 (inter-integrated circuit)	Yes									
IRQ (interrupt request input)	Yes									
INTC (interrupt controller)	Yes									
KBI (keyboard interrupts)	Yes									
LVD (low-voltage detector)	Yes									
MCG (multipurpose clock generator)	Yes									
OSC (crystal oscillator)	Yes									
Port I/O[2]	69	54	69	54	36	69	54	69	54	36
RGPIO (rapid general-purpose I/O)	16				12	16				12
SCI1, SCI2 (serial communications interfaces)	Yes									
SPI1 (serial peripheral interface)	Yes									
SPI2 (serial peripheral interface)	Yes	No	Yes	No		Yes	No	Yes	No	
FTM1 (flexible timer module) channels	6				4	6				4
FTM2 channels	6	2	6	2	2	6	2	6	2	2

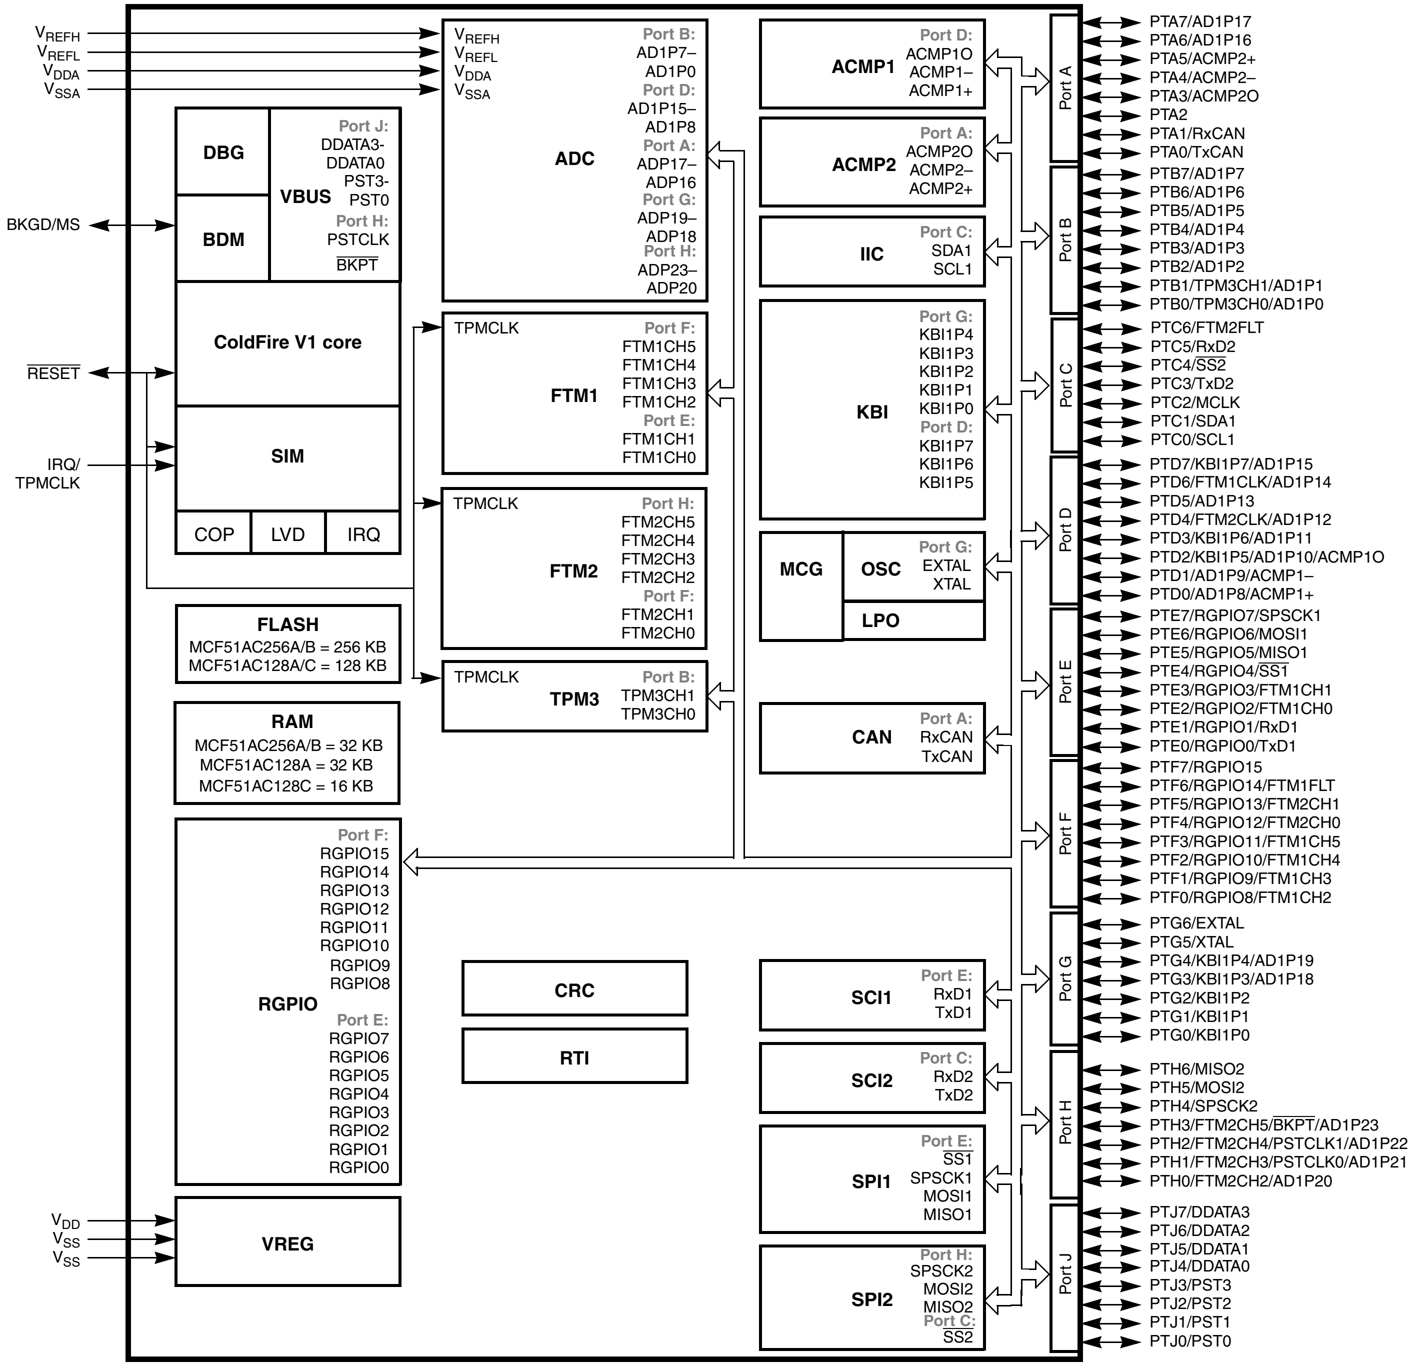

Figure 1. MCF51AC256 Series Block Diagram

- — Trimmable internal reference allows 0.2% resolution and 2% deviation
- Analog-to-digital converter (ADC)
  - — 24 analog inputs with 12 bits resolution
  - — Output formatted in 12-, 10- or 8-bit right-justified format
  - — Single or continuous conversion (automatic return to idle after single conversion)
  - — Operation in low-power modes for lower noise operation
  - — Asynchronous clock source for lower noise operation
  - — Automatic compare with interrupt for less-than, or greater-than or equal-to, programmable value
  - — On-chip temperature sensor
- Flexible timer/pulse-width modulators (FTM)
  - — 16-bit Free-running counter or a counter with initial and final value. The counting can be up and unsigned, up and signed, or up-down and unsigned
  - — Up to 6 channels, and each channel can be configured for input capture, output compare or edge-aligned PWM mode, all channels can be configured for center-aligned PWM mode
    - – Channels can operate as pairs with equal outputs, pairs with complimentary outputs or independent channels (with independent outputs)
    - – Each pair of channels can be combined to generate a PWM signal (with independent control of both edges of PWM signal)
    - – Deadtime insertion is available for each complementary pair
  - — The load of the FTM registers which have write buffer can be synchronized; write protection for critical registers
  - — Generation of the triggers to ADC (hardware trigger)
  - — A fault input for global fault control
  - — Backwards compatible with TPM
- Timer/pulse width modulator (TPM)
  - — 16-bit free-running or modulo up/down count operation
  - — Two channels, each channel may be input capture, output compare, or edge-aligned PWM
  - — One interrupt per channel plus terminal count interrupt
- Cyclic redundancy check (CRC) generator
  - — High speed hardware CRC generator circuit using 16-bit shift register
  - — CRC16-CCITT compliancy with $x^{16} + x^{12} + x^5 + 1$ polynomial
  - — Error detection for all single, double, odd, and most multi-bit errors
  - — Programmable initial seed value
- Analog comparators (ACMP)
  - — Full rail to rail supply operation
  - — Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
  - — Option to compare to fixed internal bandgap reference voltage
  - — Option to allow comparator output to be visible on a pin, ACMPxO

— Double-buffered transmit and receive
— Serial clock phase and polarity options
— Slave select output
— Selectable MSB-first or LSB-first shifting
— 16-bit and FIFO operations in SPI2

- Input/Output
  — 69 GPIOs
  — 8 keyboard interrupt pins with selectable polarity
  — Hysteresis and configurable pull-up device on all input pins; Configurable slew rate and drive strength on all output pins
  — 16-bits Rapid GPIO pins connected to the processor's local 32-bit platform bus with set, clear, and faster toggle functionality

1.4 Part Numbers

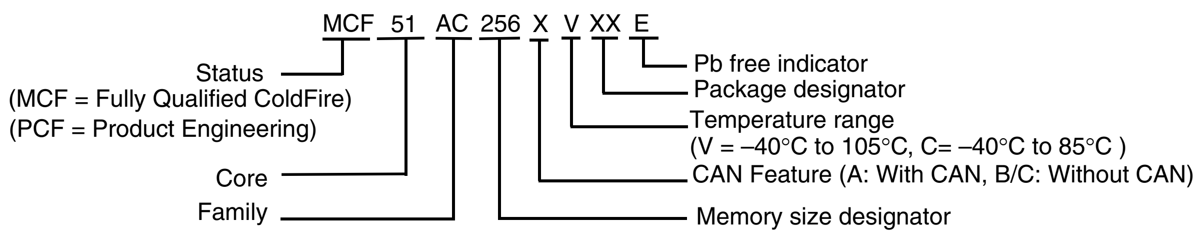

Table 3. Orderable Part Number Summary

Freescale Part Number	Description	Flash / SRAM (Kbytes)	Package	Temperature
MCF51AC256AVFUE	MCF51AC256 ColdFire Microcontroller with CAN	256 / 32	64 QFP	–40°C to 105°C
MCF51AC256BVFUE	MCF51AC256 ColdFire Microcontroller without CAN	256 / 32	64 QFP	–40°C to 105°C

2 Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the MCF51AC256 microcontroller, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

2.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 5. Parameter Classifications

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

2.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in Table 6 may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}).

Table 6. Absolute Maximum Ratings

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	–0.3 to 5.8	V
Input voltage	V_{In}	–0.3 to V_{DD} + 0.3	V
Instantaneous maximum current Single pin limit (applies to all port pins)[1], [2], [3]	I_D	±25	mA
Maximum current into V_{DD}	I_{DD}	120	mA
Storage temperature	T_{stg}	–55 to 150	°C

[1] Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive (V_{DD}) and negative (V_{SS}) clamp voltages, then use the larger of the two resistance values.

[2] All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

[3] Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low which would reduce overall power consumption.

2.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. In order to take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 7. Thermal Characteristics

Rating	Symbol	Value	Unit
Operating temperature range (packaged)	T_A	–40 to 105	°C
Maximum junction temperature	T_J	150	°C
Thermal resistance [1,2,3,4]	θ_{JA}		°C/W
80-pin LQFP			
1s		51	
2s2p		38	
64-pin LQFP			
1s		59	
2s2p		41	
64-pin QFP			
1s		50	
2s2p		36	
44-pin LQFP			
1s		67	
2s2p		45	

[1] Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance
[2] Junction to Ambient Natural Convection
[3] 1s — Single layer board, one signal layer
[4] 2s2p — Four layer board, 2 signal and 2 power layers

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \textit{Eqn. 1}$$

where:

T_A = Ambient temperature, °C
θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W
$P_D = P_{int} + P_{I/O}$
$P_{int} = I_{DD} \times V_{DD}$, Watts — chip internal power
$P_{I/O}$ = Power dissipation on input and output pins — user determined

For most applications, $P_{I/O} << P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273°C) \quad \textit{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273°C) + \theta_{JA} \times (P_D)^2 \quad \textit{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving Equation 1 and Equation 2 iteratively for any value of T_A.

2.4 Electrostatic Discharge (ESD) Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (http://www.aecouncil.com/) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete dc parametric and functional testing is performed per the

Table 10. DC Characteristics (continued)

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit
22	D	DC injection current[5 6 7 8] (single pin limit) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$	I_{IC}	0 0	—	2 –0.2	mA
		DC injection current (Total MCU limit, includes sum of all stressed pins) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$		0 0	—	25 –5	mA

1 Typical values are based on characterization data at 25°C unless otherwise stated.

2 Measured with $V_{In} = V_{DD}$ or V_{SS}.

3 Measured with $V_{In} = V_{SS}$.

4 Measured with $V_{In} = V_{DD}$.

5 Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

6 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

7 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

8 The $\overline{\text{RESET}}$ pin does not have a clamp diode to V_{DD}. Do not drive this pin above V_{DD}.

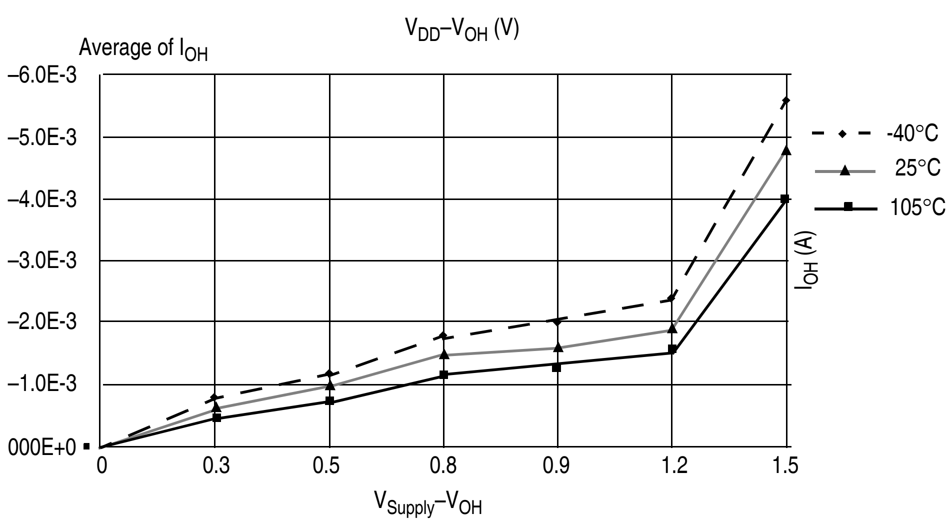

Figure 5. Typical I_{OH} vs. $V_{DD}–V_{OH}$ at V_{DD} = 3 V (Low Drive, PTxDSn = 0)

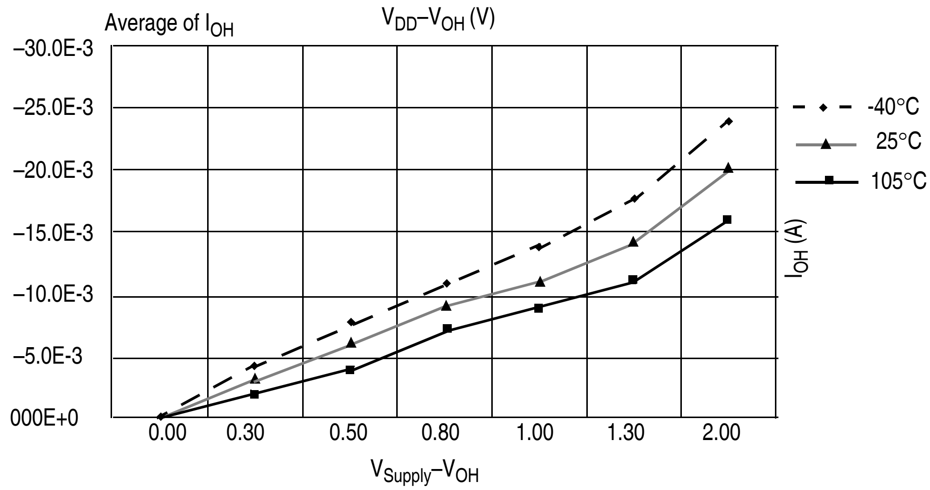

Figure 8. Typical I_{OH} vs. V_{DD}–V_{OH} at V_{DD} = 5 V (High Drive, PTxDSn = 1)

2.8 ADC Characteristics

Table 13. 5 Volt 12-bit ADC Operating Conditions

Num	C	Characteristic	Conditions	Symb	Min	Typical[1]	Max	Unit	Comment
1	D	Supply voltage	Absolute	V_{DDA}	2.7	—	5.5	V	
	D		Delta to V_{DD} ($V_{DD} - V_{DDA}$)[2]	ΔV_{DDA}	–100	0	100	mV	
2	D	Ground voltage	Delta to V_{SS} ($V_{SS} - V_{SSA}$)[2]	ΔV_{SSA}	–100	0	100	mV	
3	D	Reference voltage high		V_{REFH}	2.7	V_{DDA}	V_{DDA}	V	
4	D	Reference voltage low		V_{REFL}	V_{SSA}	V_{SSA}	V_{SSA}	V	
5	D	Input voltage		V_{ADIN}	V_{REFL}	—	V_{REFH}	V	
6	C	Input capacitance		C_{ADIN}	—	4.5	5.5	pF	
7	C	Input resistance		R_{ADIN}	—	3	5	kΩ	
8	C	Analog source resistance	12-bit mode $f_{ADCK} > 4MHz$ $f_{ADCK} < 4MHz$	R_{AS}	— —	— —	2 5	kΩ	External to MCU
	C		10-bit mode $f_{ADCK} > 4MHz$ $f_{ADCK} < 4MHz$		— —	— —	5 10		
	C		8-bit mode (all valid f_{ADCK})		—	—	10		
9	D	ADC conversion clock frequency	High speed (ADLPC = 0)	f_{ADCK}	0.4	—	8.0	MHz	
	D		Low power (ADLPC = 1)		0.4	—	4.0		

1 Typical values assume V_{DDA} = 5.0 V, Temp = 25 °C, f_{ADCK} = 1.0 MHz unless otherwise stated. Typical values are for reference only and are not tested in production.

2 DC potential difference.

Table 14. 5 Volt 12-bit ADC Characteristics ($V_{REFH} = V_{DDA}$, $V_{REFL} = V_{SSA}$) (continued)

Num	C	Characteristic	Conditions	Symb	Min	Typical[1]	Max	Unit	Comment

			8-bit mode		—	—	±0.5		
15	D	Input leakage error	12-bit mode	E_{IL}	—	±1	—	LSB[2]	Pad leakage[4] * R_{AS}
			10-bit mode		—	±0.2	±2.5		
			8-bit mode		—	±0.1	±1		
16	D	Temp sensor voltage	25°C	V_{TEMP25}	—	1.396	—	V	
17	D	Temp sensor slope	–40 °C–25 °C	m	—	3.266	—	mV/°C	
			25 °C–85 °C		—	3.638	—		

1 Typical values assume V_{DDA} = 5.0 V, Temp = 25 °C, f_{ADCK} = 1.0 MHz unless otherwise stated. Typical values are for reference only and are not tested in production.

2 1 LSB = $(V_{REFH} - V_{REFL})/2^N$.

3 Monotonicity and No-Missing-Codes guaranteed in 10-bit and 8-bit modes
4 Based on input pad leakage current. Refer to pad electricals.

2.9 External Oscillator (XOSC) Characteristics

Table 15. Oscillator Electrical Specifications (Temperature Range = –40 to 105 °C Ambient)

Num	C	Rating	Symbol	Min	Typical[1]	Max	Unit
1	C	Oscillator crystal or resonator (EREFS = 1, ERCLKEN = 1) Low range (RANGE = 0) High range (RANGE = 1) FEE or FBE mode[2] High range (RANGE = 1) PEE or PBE mode[3] High range (RANGE = 1, HGO = 1) BLPE mode High range (RANGE = 1, HGO = 0) BLPE mode	 f_{lo} $f_{hi\text{-}fll}$ $f_{hi\text{-}pll}$ $f_{hi\text{-}hgo}$ $f_{hi\text{-}lp}$	 32 1 1 1 1	 — — — — —	 38.4 5 16 16 8	 kHz MHz MHz MHz MHz
2	—	Load capacitors	C_1 C_2	See crystal or resonator manufacturer's recommendation.			
3	—	Feedback resistor Low range (32 kHz to 38.4 kHz) High range (1 MHz to 16 MHz)	R_F		 10 1		MΩ
4	—	Series resistor Low range, low gain (RANGE = 0, HGO = 0) Low range, high gain (RANGE = 0, HGO = 1) High range, low gain (RANGE = 1, HGO = 0) High range, high gain (RANGE = 1, HGO = 1) ≥ 8 MHz 4 MHz 1 MHz	R_S	 — — — — — —	 0 100 0 0 0 0	 — — — 0 10 20	kΩ
5	T	Crystal start-up time[4] Low range, low gain (RANGE = 0, HGO = 0) Low range, high gain (RANGE = 0, HGO = 1) High range, low gain (RANGE = 1, HGO = 0)[5] High range, high gain (RANGE = 1, HGO = 1)[5]	 $t_{CSTL\text{-}LP}$ $t_{CSTL\text{-}HGO}$ $t_{CSTH\text{-}LP}$ $t_{CSTH\text{-}HGO}$	 — — — —	 200 400 5 15	 — — — —	ms
6	T	Square wave input clock frequency (EREFS = 0, ERCLKEN = 1) FEE or FBE mode[2] PEE or PBE mode[3] BLPE mode	f_{extal}	 0.03125 1 0	 — — —	 5 16 40	MHz

1 Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2 When MCG is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.
3 When MCG is configured for PEE or PBE mode, input clock source must be divisible using RDIV to within the range of 1 MHz to 2 MHz.
4 This parameter is characterized and not tested on each device. Proper PC board layout procedures must be followed to achieve specifications.
5 4 MHz crystal

2.11.2 Timer (TPM/FTM) Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 18. TPM/FTM Input Timing

NUM	C	Function	Symbol	Min	Max	Unit
1	—	External clock frequency	f_{TPMext}	DC	$f_{Bus}/4$	MHz
2	—	External clock period	t_{TPMext}	4	—	t_{cyc}
3	D	External clock high time	t_{clkh}	1.5	—	t_{cyc}
4	D	External clock low time	t_{clkl}	1.5	—	t_{cyc}
5	D	Input capture pulse width	t_{ICPW}	1.5	—	t_{cyc}

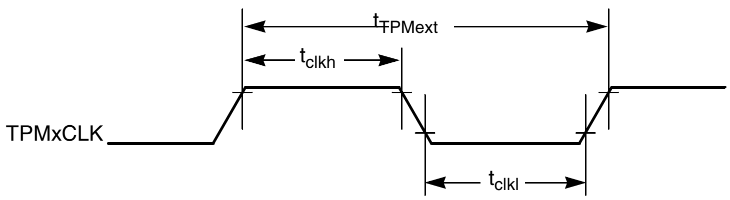

Figure 13. Timer External Clock

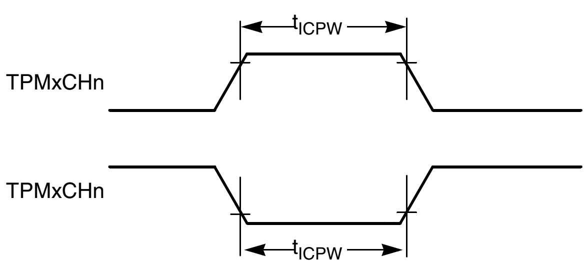

Figure 14. Timer Input Capture Pulse

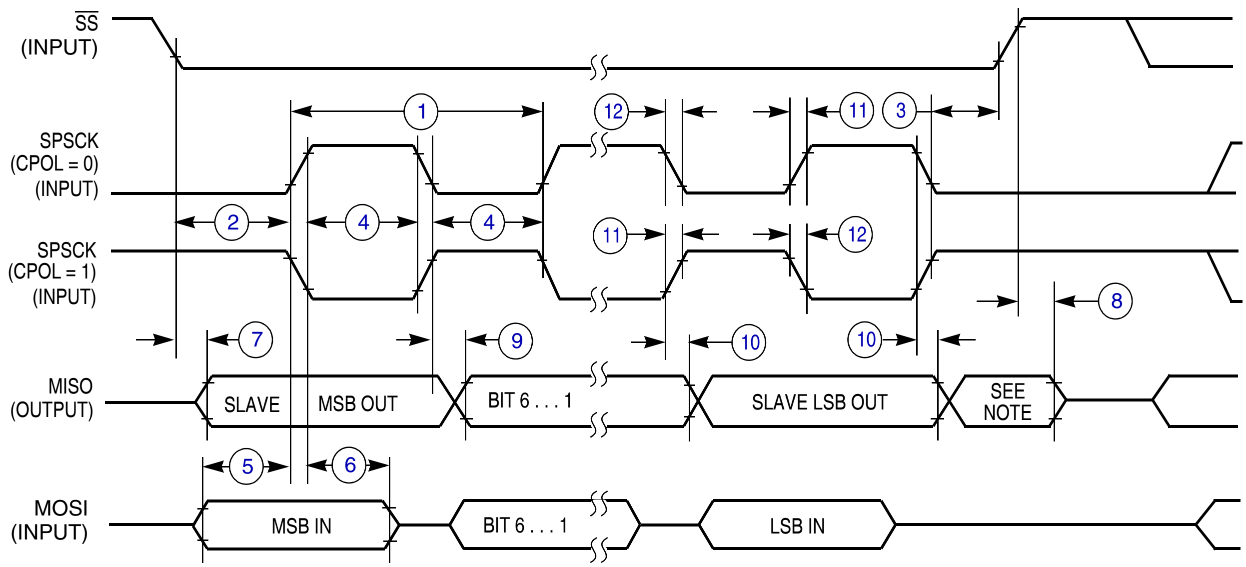
2.11.3 MSCAN

Table 19. MSCAN Wake-Up Pulse Characteristics

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit
1	D	MSCAN wake-up dominant pulse filtered	t_{WUP}	—	—	2	µs
2	D	MSCAN wake-up dominant pulse pass	t_{WUP}	5	—	5	µs

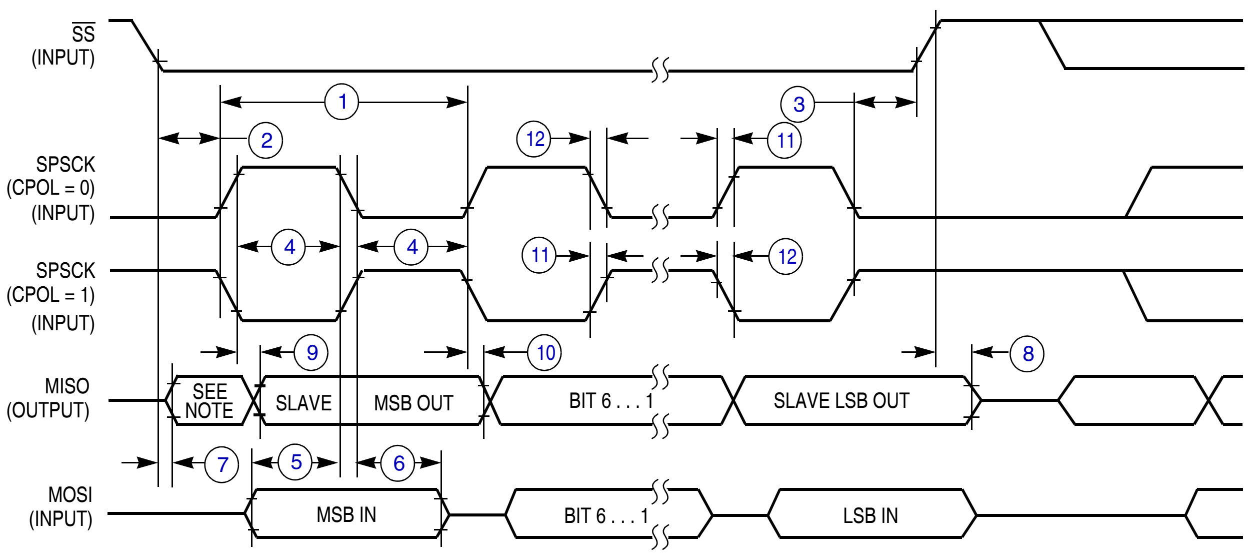
1 Typical values are based on characterization data at V_{DD} = 5.0 V, 25 °C unless otherwise stated.



NOTE:

1. Not defined but normally MSB of character just received

Figure 17. SPI Slave Timing (CPHA = 0)



NOTE:

1. Not defined but normally LSB of character just received

Figure 18. SPI Slave Timing (CPHA = 1)

2.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the Flash memory.

Program and erase operations do not require any special power sources other than the normal V_{DD} supply. For more detailed information about program/erase operations, see Chapter 4, “Memory.”
