What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	Coldfire V1
Core Size	32-Bit Single-Core
Speed	50MHz
Connectivity	I²C, SCI, SPI
Peripherals	LVD, PWM, WDT
Number of I/O	54
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 20x12b
Oscillator Type	External
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	64-QFP
Supplier Device Package	64-QFP (14x14)

1.3 Features

Table 2 describes the functional units of the MCF51AC256 series.

Table 2. MCF51AC256 Series Functional Units

Functional Unit	Function
CF1 Core (V1 ColdFire core)	Executes programs and interrupt handlers
BDM (background debug module)	Provides single pin debugging interface (part of the V1 ColdFire core)
DBG (debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
VBUS (debug visibility bus)	Allows for real-time program traces (part of the V1 ColdFire core)
SIM (system integration module)	Controls resets and chip level interfaces between modules
Flash (flash memory)	Provides storage for program code, constants and variables
RAM (random-access memory)	Provides storage for program variables
RGPIO (rapid general-purpose input/output)	Allows for I/O port access at CPU clock speeds
VREG (voltage regulator)	Controls power management across the device
COP (computer operating properly)	Monitors a countdown timer and generates a reset if the timer is not regularly reset by the software
LVD (low-voltage detect)	Monitors internal and external supply voltage levels, and generates a reset or interrupt when the voltages are too low
CF1_INTC (interrupt controller)	Controls and prioritizes all device interrupts
ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution
FTM1, FTM2 (flexible timer/pulse-width modulators)	Provides a variety of timing-based features
TPM3 (timer/pulse-width modulator)	Provides a variety of timing-based features
CRC (cyclic redundancy check)	Accelerates computation of CRC values for ranges of memory
ACMP1, ACMP2 (analog comparators)	Compares two analog inputs
IIC (inter-integrated circuit)	Supports standard IIC communications protocol
KBI (keyboard interrupt)	Provides pin interrupt capabilities
MCG (multipurpose clock generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources
OSC (crystal oscillator)	Allows a crystal or ceramic resonator to be used as the system clock source or reference clock for the PLL or FLL
LPO (low-power oscillator)	Provides a second clock source for COP and RTI.
CAN (controller area network)	Supports standard CAN communications protocol
SCI1, SCI2 (serial communications interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols
SPI1 (8-bit serial peripheral interfaces)	Provides 8-bit 4-pin synchronous serial interface
SPI2 (16-bit serial peripheral interfaces)	Provides 16-bit 4-pin synchronous serial interface with FIFO

  - Trimmable internal reference allows 0.2% resolution and 2% deviation
- Analog-to-digital converter (ADC)
  - 24 analog inputs with 12 bits resolution
  - Output formatted in 12-, 10- or 8-bit right-justified format
  - Single or continuous conversion (automatic return to idle after single conversion)
  - Operation in low-power modes for lower noise operation
  - Asynchronous clock source for lower noise operation
  - Automatic compare with interrupt for less-than, or greater-than or equal-to, programmable value
  - On-chip temperature sensor
- Flexible timer/pulse-width modulators (FTM)
  - 16-bit Free-running counter or a counter with initial and final value. The counting can be up and unsigned, up and signed, or up-down and unsigned
  - Up to 6 channels, and each channel can be configured for input capture, output compare or edge-aligned PWM mode, all channels can be configured for center-aligned PWM mode
    - Channels can operate as pairs with equal outputs, pairs with complimentary outputs or independent channels (with independent outputs)
    - Each pair of channels can be combined to generate a PWM signal (with independent control of both edges of PWM signal)
    - Deadtime insertion is available for each complementary pair
  - The load of the FTM registers which have write buffer can be synchronized; write protection for critical registers
  - Generation of the triggers to ADC (hardware trigger)
  - A fault input for global fault control
  - Backwards compatible with TPM
- Timer/pulse width modulator (TPM)
  - 16-bit free-running or modulo up/down count operation
  - Two channels, each channel may be input capture, output compare, or edge-aligned PWM
  - One interrupt per channel plus terminal count interrupt
- Cyclic redundancy check (CRC) generator
  - High speed hardware CRC generator circuit using 16-bit shift register
  - CRC16-CCITT compliancy with $x^{16} + x^{12} + x^5 + 1$ polynomial
  - Error detection for all single, double, odd, and most multi-bit errors
  - Programmable initial seed value
- Analog comparators (ACMP)
  - Full rail to rail supply operation
  - Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
  - Option to compare to fixed internal bandgap reference voltage
  - Option to allow comparator output to be visible on a pin, ACMPxO

- Inter-integrated circuit (IIC)
  - Compatible with IIC bus standard
  - Multi-master operation
  - Software programmable for one of 64 different serial clock frequencies
  - Interrupt driven byte-by-byte data transfer
  - Arbitration lost interrupt with automatic mode switching from master to slave
  - Calling address identification interrupt
  - Bus busy detection
  - 10-bit address extension
- Controller area network (CAN)
  - Implementation of the CAN protocol — Version 2.0A/B
    - Standard and extended data frames
    - Zero to eight bytes data length
    - Programmable bit rate up to 1 Mbps
    - Support for remote frames
  - Five receive buffers with FIFO storage scheme
  - Three transmit buffers with internal prioritization using a “local priority” concept
  - Flexible maskable identifier filter supports two full-size (32-bit) extended identifier filters, four 16-bit filters, or eight 8-bit filters
  - Programmable wakeup functionality with integrated low-pass filter
  - Programmable loopback mode supports self-test operation
  - Programmable listen-only mode for monitoring of CAN bus
  - Programmable bus-off recovery functionality
  - Separate signalling and interrupt capabilities for all CAN receiver and transmitter error states (warning, error passive, bus-off)
  - Internal timer for time-stamping of received and transmitted messages
- Serial communications interfaces (SCI)
  - Full-duplex, standard non-return-to-zero (NRZ) format
  - Double-buffered transmitter and receiver with separate enables
  - Programmable baud rates (13-bit modulo divider)
  - Interrupt-driven or polled operation
  - Hardware parity generation and checking
  - Programmable 8-bit or 9-bit character length
  - Receiver wakeup by idle-line or address-mark
  - Optional 13-bit break character generation / 11-bit break character detection
  - Selectable transmitter output polarity
- Serial peripheral interfaces (SPI)
  - Master or slave mode operation
  - Full-duplex or single-wire bidirectional option
  - Programmable transmit bit rate

— Double-buffered transmit and receive
— Serial clock phase and polarity options
— Slave select output
— Selectable MSB-first or LSB-first shifting
— 16-bit and FIFO operations in SPI2

- Input/Output
  — 69 GPIOs
  — 8 keyboard interrupt pins with selectable polarity
  — Hysteresis and configurable pull-up device on all input pins; Configurable slew rate and drive strength on all output pins
  — 16-bits Rapid GPIO pins connected to the processor's local 32-bit platform bus with set, clear, and faster toggle functionality

Table 10. DC Characteristics (continued)

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit
22	D	DC injection current[5 6 7 8] (single pin limit) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$	I_{IC}	 0 0	—	 2 –0.2	mA
		DC injection current (Total MCU limit, includes sum of all stressed pins) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$		 0 0	—	 25 –5	mA

1 Typical values are based on characterization data at 25°C unless otherwise stated.

2 Measured with $V_{In} = V_{DD}$ or V_{SS}.

3 Measured with $V_{In} = V_{SS}$.

4 Measured with $V_{In} = V_{DD}$.

5 Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

6 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

7 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

8 The $\overline{\text{RESET}}$ pin does not have a clamp diode to V_{DD}. Do not drive this pin above V_{DD}.

1 Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.

2 When MCG is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.

3 When MCG is configured for PEE or PBE mode, input clock source must be divisible using RDIV to within the range of 1 MHz to 2 MHz.

4 This parameter is characterized and not tested on each device. Proper PC board layout procedures must be followed to achieve specifications.

Table 16. MCG Frequency Specifications (continued)(Temperature Range = –40 to 105 °C Ambient)

Num	C	Rating	Symbol	Min	Typical[1]	Max	Unit
18	D	Lock exit frequency tolerance [8]	D_{unl}	±4.47	—	±5.97	%
19	D	Lock time — FLL	t_{fll_lock}	—	—	$t_{fll\_acquire}$+ 1075(1/f_{int_t})	s
20	D	Lock time — PLL	t_{pll_lock}	—	—	$t_{pll\_acquire}$+ 1075(1/f_{pll_ref})	s
21	D	Loss of external clock minimum frequency — RANGE = 0	f_{loc_low}	(3/5) × f_{int}	—	—	kHz

1 Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.

2 The resulting bus clock frequency must not exceed the maximum specified bus clock frequency of the device.

3 This specification applies when the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

4 This specification applies when the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

5 Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{BUS}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

6 625 ns represents 5 time quanta for CAN applications, under worst case conditions of 8 MHz CAN bus clock, 1 Mbps CAN bus speed, and 8 time quanta per bit for bit time settings. 5 time quanta is the minimum time between a synchronization edge and the sample point of a bit using 8 time quanta per bit.

7 Below D_{lock} minimum, the MCG enters lock. Above D_{lock} maximum, the MCG will not enter lock. But if the MCG is already in lock, then the MCG may stay in lock.

8 Below D_{unl} minimum, the MCG will not exit lock if already in lock. Above D_{unl} maximum, the MCG is guaranteed to exit lock.

2.11 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

2.11.1 Control Timing

Table 17. Control Timing

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit

8	D	KBIPx pulse width Asynchronous path[2] Synchronous path[3]	t_{ILIH}, t_{IHIL}	 100 1.5 × t_{cyc}	—	—	ns
9	D	Port rise and fall time (load = 50 pF)[4] Slew rate control disabled (PTxSE = 0), Low Drive Slew rate control enabled (PTxSE = 1), Low Drive Slew rate control disabled (PTxSE = 0), Low Drive Slew rate control enabled (PTxSE = 1), Low Drive	t_{Rise}, t_{Fall}	 — — — —	 11 35 40 75	—	ns

1 Typical values are based on characterization data at V_{DD} = 5.0 V, 25 °C unless otherwise stated.

2 This is the shortest pulse that is guaranteed to be recognized as a reset pin request. Shorter pulses are not guaranteed to override reset requests from internal sources.

3 This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

4 Timing is shown with respect to 20% V_{DD} and 80% V_{DD} levels. Temperature range –40 °C to 105 °C.

10	C	Data retention[5]	t_{D_ret}	15	100	—	years

1 Typical values are based on characterization data at V_{DD} = 5.0 V, 25 °C unless otherwise stated.

2 The frequency of this clock is controlled by a software setting.

3 These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

4 **Typical endurance for flash** was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale Semiconductor defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory.*

5 **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale Semiconductor defines typical data retention, please refer to Engineering Bulletin EB618/D, *Typical Data Retention for Nonvolatile Memory.*

2.14 EMC Performance

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

2.14.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM Cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East). For more detailed information concerning the evaluation results, conditions and setup, please refer to the EMC Evaluation Report for this device.
