What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Coldfire V1
Core Size	32-Bit Single-Core
Speed	50MHz
Connectivity	CANbus, I²C, SCI, SPI
Peripherals	LVD, PWM, WDT
Number of I/O	69
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 24x12b
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	80-LQFP
Supplier Device Package	80-LQFP (14x14)

1.3 Features

Table 2 describes the functional units of the MCF51AC256 series.

Table 2. MCF51AC256 Series Functional Units

Functional Unit	Function
CF1 Core (V1 ColdFire core)	Executes programs and interrupt handlers
BDM (background debug module)	Provides single pin debugging interface (part of the V1 ColdFire core)
DBG (debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
VBUS (debug visibility bus)	Allows for real-time program traces (part of the V1 ColdFire core)
SIM (system integration module)	Controls resets and chip level interfaces between modules
Flash (flash memory)	Provides storage for program code, constants and variables
RAM (random-access memory)	Provides storage for program variables
RGPIO (rapid general-purpose input/output)	Allows for I/O port access at CPU clock speeds
VREG (voltage regulator)	Controls power management across the device
COP (computer operating properly)	Monitors a countdown timer and generates a reset if the timer is not regularly reset by the software
LVD (low-voltage detect)	Monitors internal and external supply voltage levels, and generates a reset or interrupt when the voltages are too low
CF1_INTC (interrupt controller)	Controls and prioritizes all device interrupts
ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution
FTM1, FTM2 (flexible timer/pulse-width modulators)	Provides a variety of timing-based features
TPM3 (timer/pulse-width modulator)	Provides a variety of timing-based features
CRC (cyclic redundancy check)	Accelerates computation of CRC values for ranges of memory
ACMP1, ACMP2 (analog comparators)	Compares two analog inputs
IIC (inter-integrated circuit)	Supports standard IIC communications protocol
KBI (keyboard interrupt)	Provides pin interrupt capabilities
MCG (multipurpose clock generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources
OSC (crystal oscillator)	Allows a crystal or ceramic resonator to be used as the system clock source or reference clock for the PLL or FLL
LPO (low-power oscillator)	Provides a second clock source for COP and RTI.
CAN (controller area network)	Supports standard CAN communications protocol
SCI1, SCI2 (serial communications interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols
SPI1 (8-bit serial peripheral interfaces)	Provides 8-bit 4-pin synchronous serial interface
SPI2 (16-bit serial peripheral interfaces)	Provides 16-bit 4-pin synchronous serial interface with FIFO

1.3.1 Feature List

- 32-bit Version 1 ColdFire® central processor unit (CPU)
  - Up to 50.33 MHz at 2.7 V – 5.5 V
  - Provide 0.94 Dhrystone 2.1 DMIPS per MHz performance when running from internal RAM (0.76 DMIPS per MHz when running from flash)
  - Implements instruction set revision C (ISA_C)
- On-chip memory
  - Up to 256 KB flash memory read/program/erase over full operating voltage and temperature
  - Up to 32 KB static random access memory (SRAM)
  - Security circuitry to prevent unauthorized access to SRAM and flash contents
- Power-Saving Modes
  - Three low-power stop plus wait modes
  - Peripheral clock enable register can disable clocks to unused modules, reducing currents; allows clocks to remain enabled to specific peripherals in stop3 mode
- System protection features
  - Watchdog computer operating properly (COP) reset with options to run from independent LPO clock or bus clock
  - Low-voltage detection with reset or interrupt
  - Illegal opcode and illegal address detection with programmable reset or exception response
  - Flash block protection
- Debug support
  - Single-wire background debug interface
  - Real-time debug support, with 6 hardware breakpoints (4 PC, 1 address pair and 1 data) that can be configured into a 1- or 2-level trigger
  - On-chip trace buffer provides programmable start/stop recording conditions plus support for continuous or PC-profiling modes
  - Support for real-time program (and optional partial data) trace using the debug visibility bus
- V1 ColdFire interrupt controller (CF1_INTC)
  - Support of 40 peripheral I/O interrupt requests plus seven software (one per level) interrupt requests
  - Fixed association between interrupt request source and level plus priority, up to two requests can be remapped to the highest maskable level + priority
  - Unique vector number for each interrupt source
  - Support for service routine interrupt acknowledge (software IACK) read cycles for improved system performance
- Multipurpose clock generator (MCG)
  - Oscillator (XOSC); loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
  - LPO clock as an optional independent clock source for COP and RTI
  - FLL/PLL controlled by internal or external reference

— Trimmable internal reference allows 0.2% resolution and 2% deviation

- Analog-to-digital converter (ADC)
  — 24 analog inputs with 12 bits resolution
  — Output formatted in 12-, 10- or 8-bit right-justified format
  — Single or continuous conversion (automatic return to idle after single conversion)
  — Operation in low-power modes for lower noise operation
  — Asynchronous clock source for lower noise operation
  — Automatic compare with interrupt for less-than, or greater-than or equal-to, programmable value
  — On-chip temperature sensor
- Flexible timer/pulse-width modulators (FTM)
  — 16-bit Free-running counter or a counter with initial and final value. The counting can be up and unsigned, up and signed, or up-down and unsigned
  — Up to 6 channels, and each channel can be configured for input capture, output compare or edge-aligned PWM mode, all channels can be configured for center-aligned PWM mode
    – Channels can operate as pairs with equal outputs, pairs with complimentary outputs or independent channels (with independent outputs)
    – Each pair of channels can be combined to generate a PWM signal (with independent control of both edges of PWM signal)
    – Deadtime insertion is available for each complementary pair
  — The load of the FTM registers which have write buffer can be synchronized; write protection for critical registers
  — Generation of the triggers to ADC (hardware trigger)
  — A fault input for global fault control
  — Backwards compatible with TPM
- Timer/pulse width modulator (TPM)
  — 16-bit free-running or modulo up/down count operation
  — Two channels, each channel may be input capture, output compare, or edge-aligned PWM
  — One interrupt per channel plus terminal count interrupt
- Cyclic redundancy check (CRC) generator
  — High speed hardware CRC generator circuit using 16-bit shift register
  — CRC16-CCITT compliancy with $x^{16} + x^{12} + x^5 + 1$ polynomial
  — Error detection for all single, double, odd, and most multi-bit errors
  — Programmable initial seed value
- Analog comparators (ACMP)
  — Full rail to rail supply operation
  — Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
  — Option to compare to fixed internal bandgap reference voltage
  — Option to allow comparator output to be visible on a pin, ACMPxO

- Inter-integrated circuit (IIC)
  - — Compatible with IIC bus standard
  - — Multi-master operation
  - — Software programmable for one of 64 different serial clock frequencies
  - — Interrupt driven byte-by-byte data transfer
  - — Arbitration lost interrupt with automatic mode switching from master to slave
  - — Calling address identification interrupt
  - — Bus busy detection
  - — 10-bit address extension
- Controller area network (CAN)
  - — Implementation of the CAN protocol — Version 2.0A/B
    - – Standard and extended data frames
    - – Zero to eight bytes data length
    - – Programmable bit rate up to 1 Mbps
    - – Support for remote frames
  - — Five receive buffers with FIFO storage scheme
  - — Three transmit buffers with internal prioritization using a "local priority" concept
  - — Flexible maskable identifier filter supports two full-size (32-bit) extended identifier filters, four 16-bit filters, or eight 8-bit filters
  - — Programmable wakeup functionality with integrated low-pass filter
  - — Programmable loopback mode supports self-test operation
  - — Programmable listen-only mode for monitoring of CAN bus
  - — Programmable bus-off recovery functionality
  - — Separate signalling and interrupt capabilities for all CAN receiver and transmitter error states (warning, error passive, bus-off)
  - — Internal timer for time-stamping of received and transmitted messages
- Serial communications interfaces (SCI)
  - — Full-duplex, standard non-return-to-zero (NRZ) format
  - — Double-buffered transmitter and receiver with separate enables
  - — Programmable baud rates (13-bit modulo divider)
  - — Interrupt-driven or polled operation
  - — Hardware parity generation and checking
  - — Programmable 8-bit or 9-bit character length
  - — Receiver wakeup by idle-line or address-mark
  - — Optional 13-bit break character generation / 11-bit break character detection
  - — Selectable transmitter output polarity
- Serial peripheral interfaces (SPI)
  - — Master or slave mode operation
  - — Full-duplex or single-wire bidirectional option
  - — Programmable transmit bit rate

[1] Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance

[2] Junction to Ambient Natural Convection

[3] 1s — Single layer board, one signal layer

[4] 2s2p — Four layer board, 2 signal and 2 power layers

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \textit{Eqn. 1}$$

where:

T_A = Ambient temperature, °C

θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$, Watts — chip internal power

$P_{I/O}$ = Power dissipation on input and output pins — user determined

For most applications, $P_{I/O} \ll P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273°C) \quad \textit{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273°C) + \theta_{JA} \times (P_D)^2 \quad \textit{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving Equation 1 and Equation 2 iteratively for any value of T_A.

2.4 Electrostatic Discharge (ESD) Protection Characteristics

Although damage from static discharge is much less common on these devices than on early CMOS circuits, normal handling precautions should be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with CDF-AEC-Q00 Stress Test Qualification for Automotive Grade Integrated Circuits. (http://www.aecouncil.com/) This device was qualified to AEC-Q100 Rev E.

A device is considered to have failed if, after exposure to ESD pulses, the device no longer meets the device specification requirements. Complete dc parametric and functional testing is performed per the

Table 10. DC Characteristics (continued)

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit
22	D	DC injection current[5,6,7,8] (single pin limit) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$	I_{IC}	0 0	—	2 –0.2	mA
		DC injection current (Total MCU limit, includes sum of all stressed pins) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$		0 0	—	25 –5	mA

1 Typical values are based on characterization data at 25°C unless otherwise stated.
2 Measured with $V_{In} = V_{DD}$ or V_{SS}.
3 Measured with $V_{In} = V_{SS}$.
4 Measured with $V_{In} = V_{DD}$.
5 Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).
6 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.
7 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
8 The $\overline{\text{RESET}}$ pin does not have a clamp diode to V_{DD}. Do not drive this pin above V_{DD}.

2.11.2 Timer (TPM/FTM) Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 18. TPM/FTM Input Timing

NUM	C	Function	Symbol	Min	Max	Unit
1	—	External clock frequency	f_{TPMext}	DC	$f_{Bus}/4$	MHz
2	—	External clock period	t_{TPMext}	4	—	t_{cyc}
3	D	External clock high time	t_{clkh}	1.5	—	t_{cyc}
4	D	External clock low time	t_{clkl}	1.5	—	t_{cyc}
5	D	Input capture pulse width	t_{ICPW}	1.5	—	t_{cyc}

2.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the Flash memory.

Program and erase operations do not require any special power sources other than the normal V_{DD} supply. For more detailed information about program/erase operations, see Chapter 4, “Memory.”

Table 21. Flash Characteristics

Num	C	Characteristic	Symbol	Min	Typical[1]	Max	Unit
1	—	Supply voltage for program/erase	$V_{prog/erase}$	2.7	—	5.5	V
2	—	Supply voltage for read operation	V_{Read}	2.7	—	5.5	V
3	—	Internal FCLK frequency[2]	f_{FCLK}	150	—	200	kHz
4	—	Internal FCLK period (1/FCLK)	t_{Fcyc}	5	—	6.67	μs
5	—	Byte program time (random location)[2]	t_{prog}	9			t_{Fcyc}
6	—	Byte program time (burst mode)[2]	t_{Burst}	4			t_{Fcyc}
7	—	Page erase time[3]	t_{Page}	4000			t_{Fcyc}
8	—	Mass erase time[2]	t_{Mass}	20,000			t_{Fcyc}
9	C	Program/erase endurance[4] T_L to T_H = –40 °C to 105 °C T = 25 °C	—	 10,000 —	 — 100,000	 — —	cycles
10	C	Data retention[5]	t_{D_ret}	15	100	—	years

1 Typical values are based on characterization data at V_{DD} = 5.0 V, 25 °C unless otherwise stated.

2 The frequency of this clock is controlled by a software setting.

3 These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

4 **Typical endurance for flash** was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale Semiconductor defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory*.

5 **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale Semiconductor defines typical data retention, please refer to Engineering Bulletin EB618/D, *Typical Data Retention for Nonvolatile Memory.*

2.14 EMC Performance

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

2.14.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM Cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East). For more detailed information concerning the evaluation results, conditions and setup, please refer to the EMC Evaluation Report for this device.
