Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Coldfire V1
Core Size	32-Bit Single-Core
Speed	50MHz
Connectivity	I²C, SCI, SPI
Peripherals	LVD, PWM, WDT
Number of I/O	54
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 20x12b
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/pcf51ac256bcpue

1.3 Features

Table 2 describes the functional units of the MCF51AC256 series.

Table 2. MCF51AC256 Series Functional Units

Functional Unit	Function
CF1 Core (V1 ColdFire core)	Executes programs and interrupt handlers
BDM (background debug module)	Provides single pin debugging interface (part of the V1 ColdFire core)
DBG (debug)	Provides debugging and emulation capabilities (part of the V1 ColdFire core)
VBUS (debug visibility bus)	Allows for real-time program traces (part of the V1 ColdFire core)
SIM (system integration module)	Controls resets and chip level interfaces between modules
Flash (flash memory)	Provides storage for program code, constants and variables
RAM (random-access memory)	Provides storage for program variables
RGPIO (rapid general-purpose input/output)	Allows for I/O port access at CPU clock speeds
VREG (voltage regulator)	Controls power management across the device
COP (computer operating properly)	Monitors a countdown timer and generates a reset if the timer is not regularly reset by the software
LVD (low-voltage detect)	Monitors internal and external supply voltage levels, and generates a reset or interrupt when the voltages are too low
CF1_INTC (interrupt controller)	Controls and prioritizes all device interrupts
ADC (analog-to-digital converter)	Measures analog voltages at up to 12 bits of resolution
FTM1, FTM2 (flexible timer/pulse-width modulators)	Provides a variety of timing-based features
TPM3 (timer/pulse-width modulator)	Provides a variety of timing-based features
CRC (cyclic redundancy check)	Accelerates computation of CRC values for ranges of memory
ACMP1, ACMP2 (analog comparators)	Compares two analog inputs
IIC (inter-integrated circuit)	Supports standard IIC communications protocol
KBI (keyboard interrupt)	Provides pin interrupt capabilities
MCG (multipurpose clock generator)	Provides clocking options for the device, including a phase-locked loop (PLL) and frequency-locked loop (FLL) for multiplying slower reference clock sources
OSC (crystal oscillator)	Allows a crystal or ceramic resonator to be used as the system clock source or reference clock for the PLL or FLL
LPO (low-power oscillator)	Provides a second clock source for COP and RTI.
CAN (controller area network)	Supports standard CAN communications protocol
SCI1, SCI2 (serial communications interfaces)	Serial communications UARTs capable of supporting RS-232 and LIN protocols
SPI1 (8-bit serial peripheral interfaces)	Provides 8-bit 4-pin synchronous serial interface
SPI2 (16-bit serial peripheral interfaces)	Provides 16-bit 4-pin synchronous serial interface with FIFO

1.3.1 Feature List

- 32-bit Version 1 ColdFire® central processor unit (CPU)
  - Up to 50.33 MHz at 2.7 V – 5.5 V
  - Provide 0.94 Dhrystone 2.1 DMIPS per MHz performance when running from internal RAM (0.76 DMIPS per MHz when running from flash)
  - Implements instruction set revision C (ISA_C)
- On-chip memory
  - Up to 256 KB flash memory read/program/erase over full operating voltage and temperature
  - Up to 32 KB static random access memory (SRAM)
  - Security circuitry to prevent unauthorized access to SRAM and flash contents
- Power-Saving Modes
  - Three low-power stop plus wait modes
  - Peripheral clock enable register can disable clocks to unused modules, reducing currents; allows clocks to remain enabled to specific peripherals in stop3 mode
- System protection features
  - Watchdog computer operating properly (COP) reset with options to run from independent LPO clock or bus clock
  - Low-voltage detection with reset or interrupt
  - Illegal opcode and illegal address detection with programmable reset or exception response
  - Flash block protection
- Debug support
  - Single-wire background debug interface
  - Real-time debug support, with 6 hardware breakpoints (4 PC, 1 address pair and 1 data) that can be configured into a 1- or 2-level trigger
  - On-chip trace buffer provides programmable start/stop recording conditions plus support for continuous or PC-profiling modes
  - Support for real-time program (and optional partial data) trace using the debug visibility bus
- V1 ColdFire interrupt controller (CF1_INTC)
  - Support of 40 peripheral I/O interrupt requests plus seven software (one per level) interrupt requests
  - Fixed association between interrupt request source and level plus priority, up to two requests can be remapped to the highest maskable level + priority
  - Unique vector number for each interrupt source
  - Support for service routine interrupt acknowledge (software IACK) read cycles for improved system performance
- Multipurpose clock generator (MCG)
  - Oscillator (XOSC); loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
  - LPO clock as an optional independent clock source for COP and RTI
  - FLL/PLL controlled by internal or external reference

  - Trimmable internal reference allows 0.2% resolution and 2% deviation
- Analog-to-digital converter (ADC)
  - 24 analog inputs with 12 bits resolution
  - Output formatted in 12-, 10- or 8-bit right-justified format
  - Single or continuous conversion (automatic return to idle after single conversion)
  - Operation in low-power modes for lower noise operation
  - Asynchronous clock source for lower noise operation
  - Automatic compare with interrupt for less-than, or greater-than or equal-to, programmable value
  - On-chip temperature sensor
- Flexible timer/pulse-width modulators (FTM)
  - 16-bit Free-running counter or a counter with initial and final value. The counting can be up and unsigned, up and signed, or up-down and unsigned
  - Up to 6 channels, and each channel can be configured for input capture, output compare or edge-aligned PWM mode, all channels can be configured for center-aligned PWM mode
    - Channels can operate as pairs with equal outputs, pairs with complimentary outputs or independent channels (with independent outputs)
    - Each pair of channels can be combined to generate a PWM signal (with independent control of both edges of PWM signal)
    - Deadtime insertion is available for each complementary pair
  - The load of the FTM registers which have write buffer can be synchronized; write protection for critical registers
  - Generation of the triggers to ADC (hardware trigger)
  - A fault input for global fault control
  - Backwards compatible with TPM
- Timer/pulse width modulator (TPM)
  - 16-bit free-running or modulo up/down count operation
  - Two channels, each channel may be input capture, output compare, or edge-aligned PWM
  - One interrupt per channel plus terminal count interrupt
- Cyclic redundancy check (CRC) generator
  - High speed hardware CRC generator circuit using 16-bit shift register
  - CRC16-CCITT compliancy with $x^{16} + x^{12} + x^5 + 1$ polynomial
  - Error detection for all single, double, odd, and most multi-bit errors
  - Programmable initial seed value
- Analog comparators (ACMP)
  - Full rail to rail supply operation
  - Selectable interrupt on rising edge, falling edge, or either rising or falling edges of comparator output
  - Option to compare to fixed internal bandgap reference voltage
  - Option to allow comparator output to be visible on a pin, ACMPxO

- Inter-integrated circuit (IIC)
  - Compatible with IIC bus standard
  - Multi-master operation
  - Software programmable for one of 64 different serial clock frequencies
  - Interrupt driven byte-by-byte data transfer
  - Arbitration lost interrupt with automatic mode switching from master to slave
  - Calling address identification interrupt
  - Bus busy detection
  - 10-bit address extension
- Controller area network (CAN)
  - Implementation of the CAN protocol — Version 2.0A/B
    - Standard and extended data frames
    - Zero to eight bytes data length
    - Programmable bit rate up to 1 Mbps
    - Support for remote frames
  - Five receive buffers with FIFO storage scheme
  - Three transmit buffers with internal prioritization using a “local priority” concept
  - Flexible maskable identifier filter supports two full-size (32-bit) extended identifier filters, four 16-bit filters, or eight 8-bit filters
  - Programmable wakeup functionality with integrated low-pass filter
  - Programmable loopback mode supports self-test operation
  - Programmable listen-only mode for monitoring of CAN bus
  - Programmable bus-off recovery functionality
  - Separate signalling and interrupt capabilities for all CAN receiver and transmitter error states (warning, error passive, bus-off)
  - Internal timer for time-stamping of received and transmitted messages
- Serial communications interfaces (SCI)
  - Full-duplex, standard non-return-to-zero (NRZ) format
  - Double-buffered transmitter and receiver with separate enables
  - Programmable baud rates (13-bit modulo divider)
  - Interrupt-driven or polled operation
  - Hardware parity generation and checking
  - Programmable 8-bit or 9-bit character length
  - Receiver wakeup by idle-line or address-mark
  - Optional 13-bit break character generation / 11-bit break character detection
  - Selectable transmitter output polarity
- Serial peripheral interfaces (SPI)
  - Master or slave mode operation
  - Full-duplex or single-wire bidirectional option
  - Programmable transmit bit rate

— Double-buffered transmit and receive
— Serial clock phase and polarity options
— Slave select output
— Selectable MSB-first or LSB-first shifting
— 16-bit and FIFO operations in SPI2

- Input/Output
  — 69 GPIOs
  — 8 keyboard interrupt pins with selectable polarity
  — Hysteresis and configurable pull-up device on all input pins; Configurable slew rate and drive strength on all output pins
  — 16-bits Rapid GPIO pins connected to the processor's local 32-bit platform bus with set, clear, and faster toggle functionality

1.4 Part Numbers

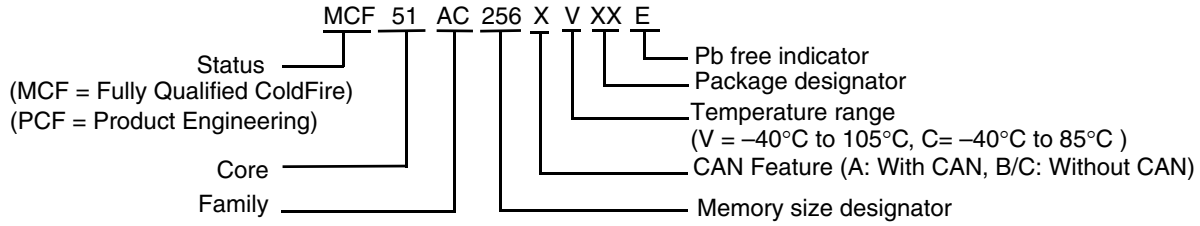

Table 3. Orderable Part Number Summary

Freescale Part Number	Description	Flash / SRAM (Kbytes)	Package	Temperature
MCF51AC256AVFUE	MCF51AC256 ColdFire Microcontroller with CAN	256 / 32	64 QFP	–40°C to 105°C
MCF51AC256BVFUE	MCF51AC256 ColdFire Microcontroller without CAN	256 / 32	64 QFP	–40°C to 105°C
MCF51AC256AVLKE	MCF51AC256 ColdFire Microcontroller with CAN	256 / 32	80 LQFP	–40°C to 105°C
MCF51AC256BVLKE	MCF51AC256 ColdFire Microcontroller without CAN	256 / 32	80 LQFP	–40°C to 105°C
MCF51AC256AVPUE	MCF51AC256 ColdFire Microcontroller with CAN	256 / 32	64 LQFP	–40°C to 105°C
MCF51AC256BVPUE	MCF51AC256 ColdFire Microcontroller without CAN	256 / 32	64 LQFP	–40°C to 105°C

1 TPMCLK, FTM1CLK, and FTM2CLK options are configured via software; out of reset, FTM1CLK, FTM2CLK, and TPMCLK are available to FTM1, FTM2, and TPM3 respectively.

2 TxCAN is available in the member that supports CAN.

3 RxCAN is available in the member that supports CAN.

2 Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the MCF51AC256 microcontroller, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

2.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 5. Parameter Classifications

P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
D	Those parameters are derived mainly from simulations.

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

2.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in Table 6 may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}).

Table 6. Absolute Maximum Ratings

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	–0.3 to 5.8	V
Input voltage	V_{In}	–0.3 to V_{DD} + 0.3	V
Instantaneous maximum current Single pin limit (applies to all port pins)[1, 2, 3]	I_D	±25	mA
Maximum current into V_{DD}	I_{DD}	120	mA
Storage temperature	T_{stg}	–55 to 150	°C

1 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive (V_{DD}) and negative (V_{SS}) clamp voltages, then use the larger of the two resistance values.

2 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

3 Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low which would reduce overall power consumption.

2.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and it is user-determined rather than being controlled by the MCU design. In order to take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 7. Thermal Characteristics

Rating		Symbol	Value	Unit
Operating temperature range (packaged)		T_A	–40 to 105	°C
Maximum junction temperature		T_J	150	°C
Thermal resistance [1,2,3,4]				
80-pin LQFP				
	1s		51	
	2s2p		38	
64-pin LQFP				
	1s		59	
	2s2p	θ_{JA}	41	°C/W
64-pin QFP				
			50	
	1s		36	
	2s2p			
44-pin LQFP				
	1s		67	
	2s2p		45	

Table 10. DC Characteristics (continued)

Num	C	Parameter	Symbol	Min	Typical[1]	Max	Unit
22	D	DC injection current[5 6 7 8] (single pin limit) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$	I_{IC}	 0 0	—	 2 –0.2	mA
		DC injection current (Total MCU limit, includes sum of all stressed pins) $V_{IN} > V_{DD}$ $V_{IN} < V_{SS}$		 0 0	—	 25 –5	mA

1 Typical values are based on characterization data at 25°C unless otherwise stated.

2 Measured with $V_{In} = V_{DD}$ or V_{SS}.

3 Measured with $V_{In} = V_{SS}$.

4 Measured with $V_{In} = V_{DD}$.

5 Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{In} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure external V_{DD} load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

6 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

7 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

8 The $\overline{\text{RESET}}$ pin does not have a clamp diode to V_{DD}. Do not drive this pin above V_{DD}.

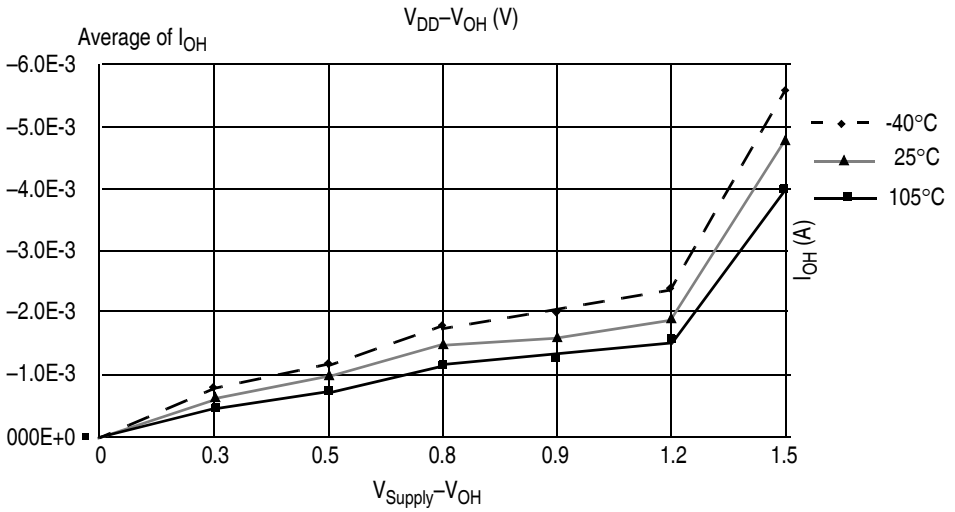

Figure 5. Typical I_{OH} vs. V_{DD}–V_{OH} at V_{DD} = 3 V (Low Drive, PTxDSn = 0)

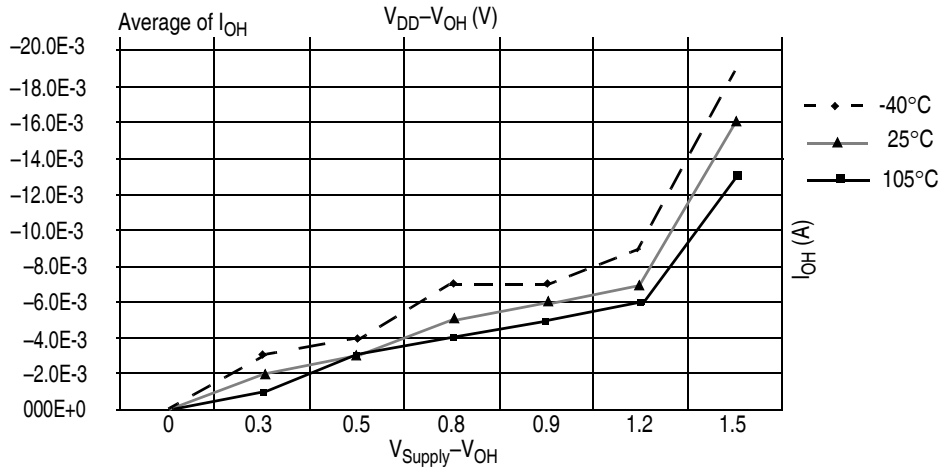

Figure 6. Typical I_{OH} vs. $V_{DD}–V_{OH}$ at V_{DD} = 3 V (High Drive, PTxDSn = 1)

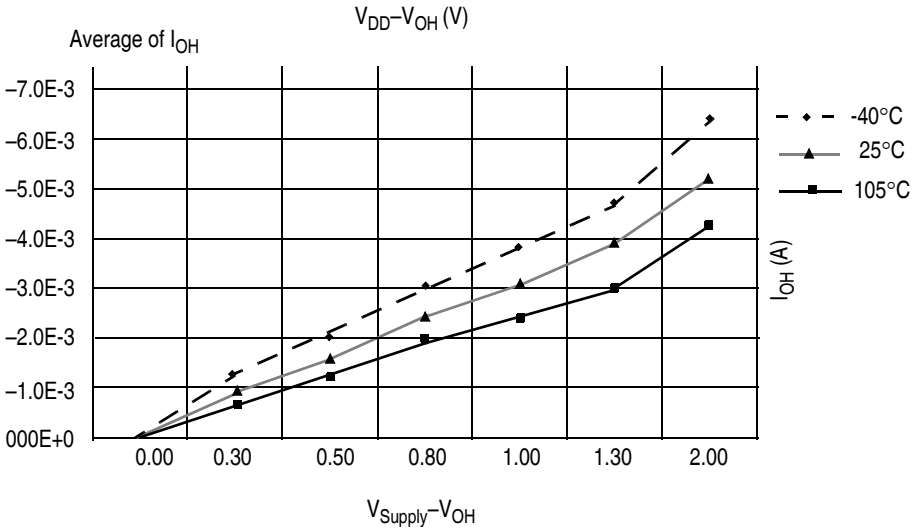

Figure 7. Typical I_{OH} vs. $V_{DD}–V_{OH}$ at V_{DD} = 5 V (Low Drive, PTxDSn = 0)

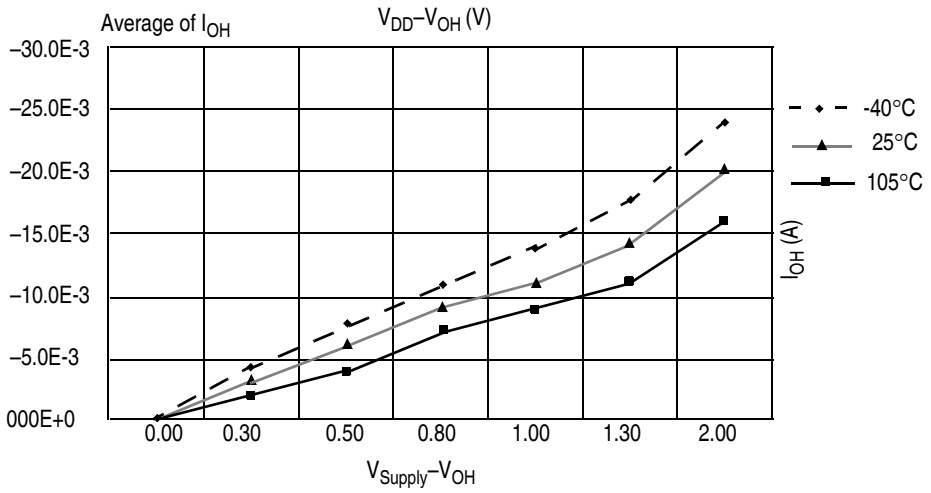

Figure 8. Typical I_{OH} vs. $V_{DD}–V_{OH}$ at V_{DD} = 5 V (High Drive, PTxDSn = 1)

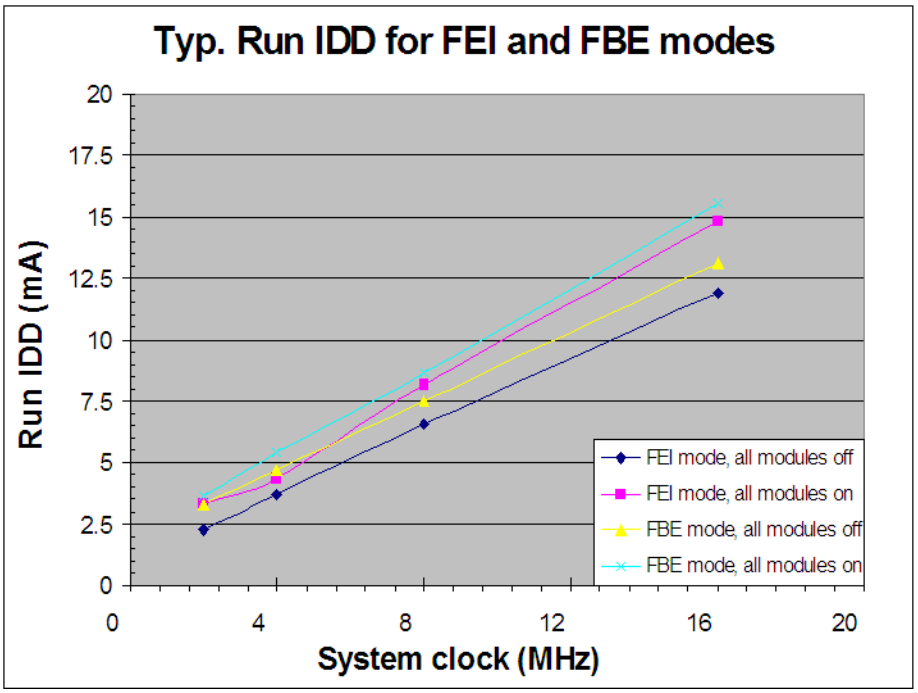

Figure 9. Typical Run I_{DD} vs. System Clock Freq. for FEI and FBE Modes

2.7 Analog Comparator (ACMP) Electricals

Table 12. Analog Comparator Electrical Specifications

Num	C	Rating	Symbol	Min	Typical	Max	Unit
1	—	Supply voltage	V_{DD}	2.7	—	5.5	V
2	T	Supply current (active)	I_{DDAC}	—	20	35	µA
3	D	Analog input voltage	V_{AIN}	V_{SS} – 0.3	—	V_{DD}	V
4	D	Analog input offset voltage	V_{AIO}	—	20	40	mV
5	D	Analog comparator hysteresis	V_H	3.0	6.0	20.0	mV
6	D	Analog input leakage current	I_{ALKG}	—	—	1.0	µA
7	D	Analog comparator initialization delay	t_{AINIT}	—	—	1.0	µs
8	P	Bandgap voltage reference factory trimmed at V_{DD} = 5.3248 V, Temp = 25 °C	V_{BG}	1.18	1.20	1.21	V

2.8 ADC Characteristics

Table 13. 5 Volt 12-bit ADC Operating Conditions

Num	C	Characteristic	Conditions	Symb	Min	Typical[1]	Max	Unit	Comment
1	D	Supply voltage	Absolute	V_{DDA}	2.7	—	5.5	V	
	D		Delta to V_{DD} ($V_{DD} - V_{DDA}$)[2]	ΔV_{DDA}	–100	0	100	mV	
2	D	Ground voltage	Delta to V_{SS} ($V_{SS} - V_{SSA}$)[2]	ΔV_{SSA}	–100	0	100	mV	
3	D	Reference voltage high		V_{REFH}	2.7	V_{DDA}	V_{DDA}	V	
4	D	Reference voltage low		V_{REFL}	V_{SSA}	V_{SSA}	V_{SSA}	V	
5	D	Input voltage		V_{ADIN}	V_{REFL}	—	V_{REFH}	V	
6	C	Input capacitance		C_{ADIN}	—	4.5	5.5	pF	
7	C	Input resistance		R_{ADIN}	—	3	5	kΩ	
8	C	Analog source resistance	12-bit mode f_{ADCK} > 4MHz f_{ADCK} < 4MHz	R_{AS}	 — —	 — —	 2 5	kΩ	External to MCU
	C		10-bit mode f_{ADCK} > 4MHz f_{ADCK} < 4MHz		 — —	 — —	 5 10		
	C		8-bit mode (all valid f_{ADCK})		—	—	10		
9	D	ADC conversion clock frequency	High speed (ADLPC = 0)	f_{ADCK}	0.4	—	8.0	MHz	
	D		Low power (ADLPC = 1)		0.4	—	4.0		

1 Typical values assume V_{DDA} = 5.0 V, Temp = 25 °C, f_{ADCK} = 1.0 MHz unless otherwise stated. Typical values are for reference only and are not tested in production.

2 DC potential difference.

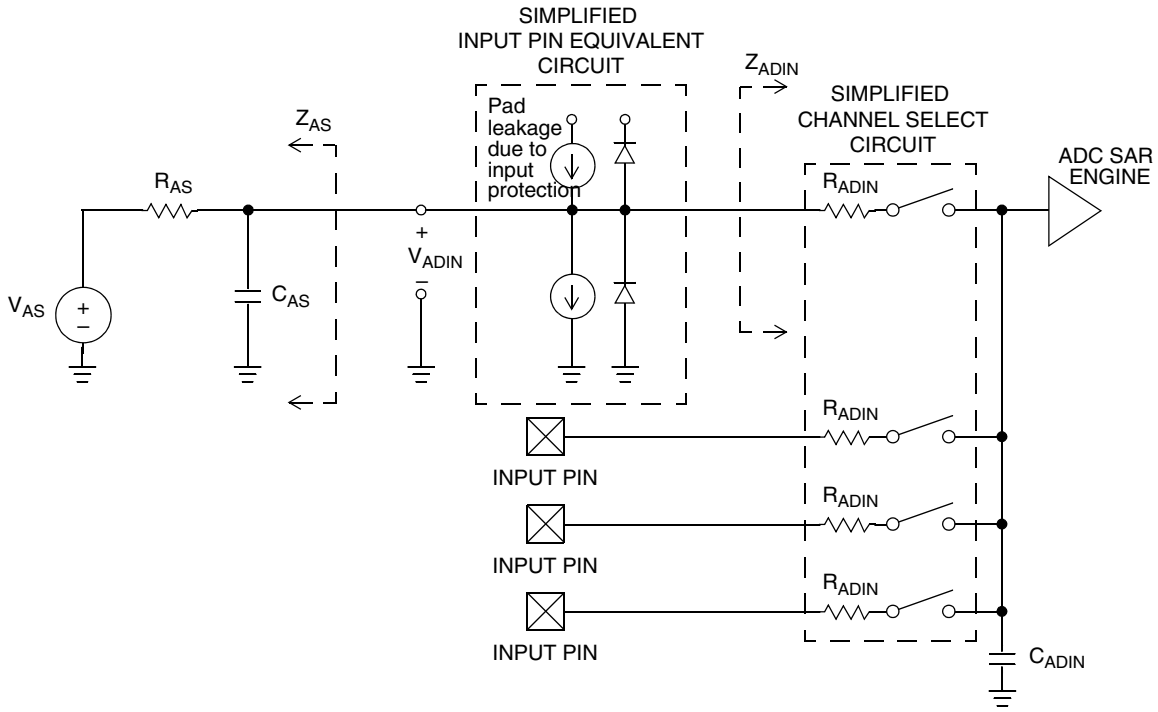

Figure 10. ADC Input Impedance Equivalency Diagram

Table 14. 5 Volt 12-bit ADC Characteristics ($V_{REFH} = V_{DDA}$, $V_{REFL} = V_{SSA}$)

Num	C	Characteristic	Conditions	Symb	Min	Typical[1]	Max	Unit	Comment
1	T	Supply current ADLPC = 1 ADLSMP = 1 ADCO = 1		I_{DDA}	—	133	—	µA	
2	T	Supply current ADLPC = 1 ADLSM = 0 ADCO = 1		I_{DDA}	—	218	—	µA	
3	T	Supply current ADLPC = 0 ADLSMP = 1 ADCO = 1		I_{DDA}	—	327	—	µA	
4	D	Supply current ADLPC = 0 ADLSMP = 0 ADCO = 1		I_{DDA}	—	0.582	1	mA	
5	T	Supply current	Stop, reset, module off	I_{DDA}	—	0.011	1	µA	
6	P	ADC asynchronous clock source	High speed (ADLPC = 0)	f_{ADACK}	2	3.3	5	MHz	$t_{ADACK} = 1/f_{ADACK}$
			Low power (ADLPC = 1)		1.25	2	3.3		

Table 14. 5 Volt 12-bit ADC Characteristics (V_{REFH} = V_{DDA}, V_{REFL} = V_{SSA}) (continued)

Num	C	Characteristic	Conditions	Symb	Min	Typical[1]	Max	Unit	Comment
7	P	Conversion time (including sample time)	Short sample (ADLSMP = 0)	t_{ADC}	—	20	—	ADCK cycles	See Table 10 for conversion time variances
			Long sample (ADLSMP = 1)		—	40	—		
8	T	Sample time	Short sample (ADLSMP = 0)	t_{ADS}	—	3.5	—	ADCK cycles	
			Long sample (ADLSMP = 1)		—	23.5	—		
9	T	Total unadjusted error	12-bit mode	E_{TUE}	—	±3.0	—	LSB[2]	Includes quantization
	P		10-bit mode		—	±1	±2.5		
	T		8-bit mode		—	±0.5	±1.0		
10	T	Differential non-linearity	12-bit mode	DNL	—	±1.75	—	LSB[2]	
	P		10-bit mode[3]		—	±0.5	±1.0		
	T		8-bit mode[3]		—	±0.3	±0.5		
11	T	Integral non-linearity	12-bit mode	INL	—	±1.5	—	LSB[2]	
	T		10-bit mode		—	±0.5	±1.0		
	T		8-bit mode		—	±0.3	±0.5		
12	T	Zero-scale error	12-bit mode	E_{ZS}	—	±1.5	—	LSB[2]	V_{ADIN} = V_{SSA}
	P		10-bit mode		—	±0.5	±1.5		
	T		8-bit mode		—	±0.5	±0.5		
13	T	Full-scale error	12-bit mode	E_{FS}	—	±1	—	LSB[2]	V_{ADIN} = V_{DDA}
	P		10-bit mode		—	±0.5	±1		
	T		8-bit mode		—	±0.5	±0.5		
14	D	Quantization error	12-bit mode	E_Q	—	–1 to 0	—	LSB[2]	
			10-bit mode		—	—	±0.5		
			8-bit mode		—	—	±0.5		
15	D	Input leakage error	12-bit mode	E_{IL}	—	±1	—	LSB[2]	Pad leakage[4] * R_{AS}
			10-bit mode		—	±0.2	±2.5		
			8-bit mode		—	±0.1	±1		
16	D	Temp sensor voltage	25°C	V_{TEMP25}	—	1.396	—	V	
17	D	Temp sensor slope	–40 °C–25 °C	m	—	3.266	—	mV/°C	
			25 °C–85 °C		—	3.638	—		

1 Typical values assume V_{DDA} = 5.0 V, Temp = 25 °C, f_{ADCK} = 1.0 MHz unless otherwise stated. Typical values are for reference only and are not tested in production.

2 1 LSB = $(V_{REFH} - V_{REFL})/2^N$.

Table 16. MCG Frequency Specifications (continued)(Temperature Range = –40 to 105 °C Ambient)

Num	C	Rating	Symbol	Min	Typical[1]	Max	Unit
18	D	Lock exit frequency tolerance [8]	D_{unl}	±4.47	—	±5.97	%
19	D	Lock time — FLL	t_{fll_lock}	—	—	$t_{fll\_acquire}$+ 1075(1/f_{int_t})	s
20	D	Lock time — PLL	t_{pll_lock}	—	—	$t_{pll\_acquire}$+ 1075(1/f_{pll_ref})	s
21	D	Loss of external clock minimum frequency — RANGE = 0	f_{loc_low}	(3/5) × f_{int}	—	—	kHz

1 Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.

2 The resulting bus clock frequency must not exceed the maximum specified bus clock frequency of the device.

3 This specification applies when the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (BLPE, BLPI) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

4 This specification applies when the PLL VCO divider or reference divider is changed, or changing from PLL disabled (BLPE, BLPI) to PLL enabled (PBE, PEE). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

5 Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{BUS}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

6 625 ns represents 5 time quanta for CAN applications, under worst case conditions of 8 MHz CAN bus clock, 1 Mbps CAN bus speed, and 8 time quanta per bit for bit time settings. 5 time quanta is the minimum time between a synchronization edge and the sample point of a bit using 8 time quanta per bit.

7 Below D_{lock} minimum, the MCG enters lock. Above D_{lock} maximum, the MCG will not enter lock. But if the MCG is already in lock, then the MCG may stay in lock.

8 Below D_{unl} minimum, the MCG will not exit lock if already in lock. Above D_{unl} maximum, the MCG is guaranteed to exit lock.

2.11 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

2.12 SPI Characteristics

Table 20 and Figure 15 through Figure 18 describe the timing requirements for the SPI system.

Table 20. SPI Timing

No.	C	Function	Symbol	Min	Max	Unit
—	D	Operating frequency Master Slave	f_{op}	$f_{Bus}/2048$ 0	$f_{Bus}/2$ $f_{Bus}/4$	Hz
1	D	SPSCK period Master Slave	t_{SPSCK}	2 4	2048 —	t_{cyc} t_{cyc}
2	D	Enable lead time Master Slave	t_{Lead}	1/2 1	— —	t_{SPSCK} t_{cyc}
3	D	Enable lag time Master Slave	t_{Lag}	1/2 1	— —	t_{SPSCK} t_{cyc}
4	D	Clock (SPSCK) high or low time Master Slave	t_{WSPSCK}	$t_{cyc} - 30$ $t_{cyc} - 30$	1024 t_{cyc} —	ns ns
5	D	Data setup time (inputs) Master Slave	t_{SU}	15 15	— —	ns ns
