

Welcome to [E-XFL.COM](#)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	150
Number of Logic Elements/Cells	1200
Total RAM Bits	9421
Number of I/O	211
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo1200c-3ft256i

Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1 and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

Memory Cascading

Larger and deeper blocks of RAMs can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

Single, Dual, Pseudo-Dual Port and FIFO Modes

Figure 2-12 shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

Figure 2-12. sysMEM Memory Primitives

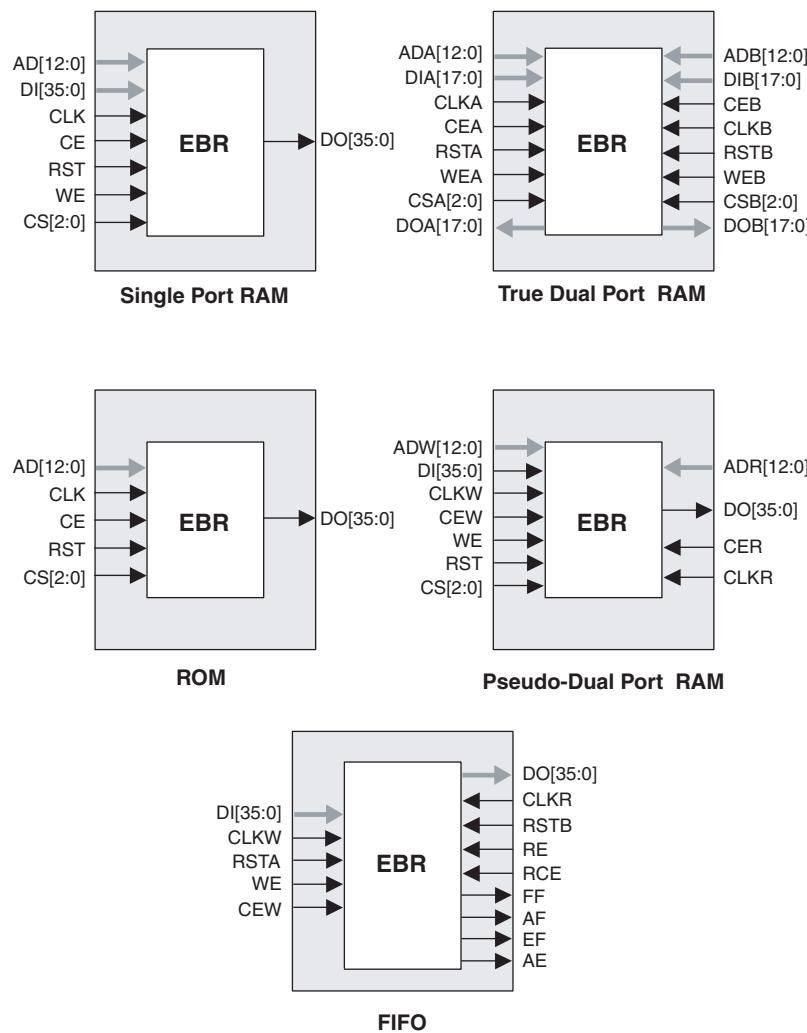

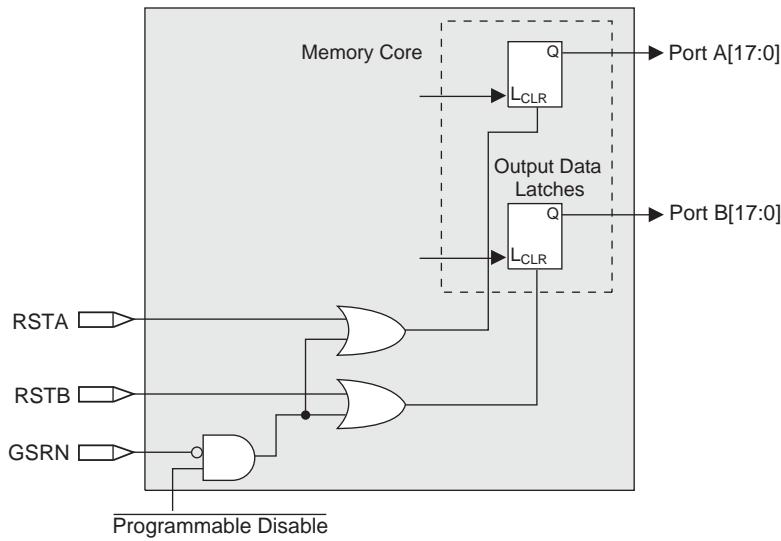

Figure 2-13. Memory Core Reset

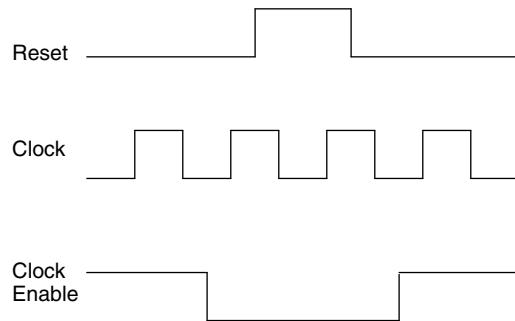

For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EGR Asynchronous Reset

EGR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EGR is always asynchronous.

Figure 2-14. EGR Asynchronous Reset (Including GSR) Timing Diagram

If all clock enables remain enabled, the EGR asynchronous reset or GSR may only be applied and released after the EGR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EGR clock). The reset release must adhere to the EGR synchronous reset setup time before the next active read or write clock edge.

If an EGR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EGR RAM, ROM and FIFO implementations. For the EGR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EGR inputs.

Note that there are no reset restrictions if the EGR synchronous reset is used and the EGR GSR input is disabled

PIO Groups

On the MachXO devices, PIO cells are assembled into two different types of PIO groups, those with four PIO cells and those with six PIO cells. PIO groups with four IOs are placed on the left and right sides of the device while PIO groups with six IOs are placed on the top and bottom. The individual PIO cells are connected to their respective sysIO buffers and PADs.

On all MachXO devices, two adjacent PIOs can be joined to provide a complementary Output driver pair. The I/O pin pairs are labeled as "T" and "C" to distinguish between the true and complement pins.

The MachXO1200 and MachXO2280 devices contain enhanced I/O capability. All PIO pairs on these larger devices can implement differential receivers. In addition, half of the PIO pairs on the left and right sides of these devices can be configured as LVDS transmit/receive pairs. PIOs on the top of these larger devices also provide PCI support.

Figure 2-15. Group of Four Programmable I/O Cells

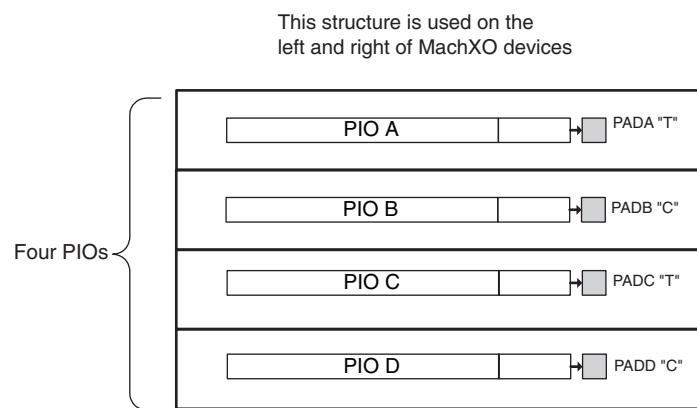

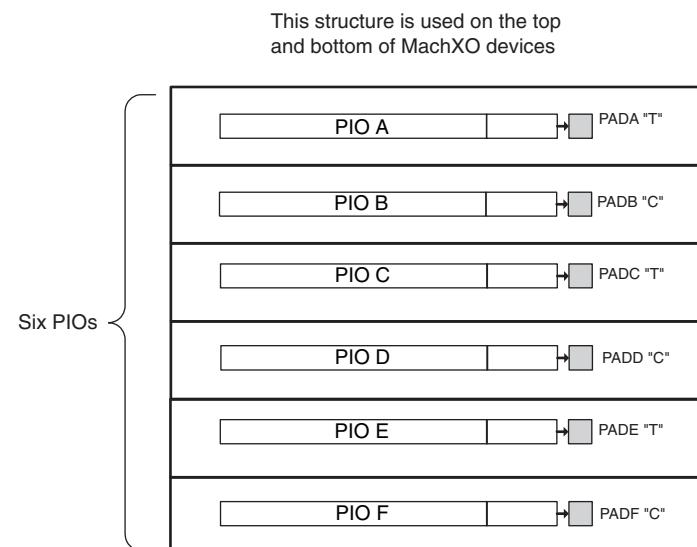

Figure 2-16. Group of Six Programmable I/O Cells

PIO

The PIO blocks provide the interface between the sysIO buffers and the internal PFU array blocks. These blocks receive output data from the PFU array and a fast output data signal from adjacent PFUs. The output data and fast

Device Configuration

All MachXO devices contain a test access port that can be used for device configuration and programming.

The non-volatile memory in the MachXO can be configured in two different modes:

- In IEEE 1532 mode via the IEEE 1149.1 port. In this mode, the device is off-line and I/Os are controlled by BSCAN registers.
- In background mode via the IEEE 1149.1 port. This allows the device to remain operational in user mode while reprogramming takes place.

The SRAM configuration memory can be configured in three different ways:

- At power-up via the on-chip non-volatile memory.
- After a refresh command is issued via the IEEE 1149.1 port.
- In IEEE 1532 mode via the IEEE 1149.1 port.

Figure 2-22 provides a pictorial representation of the different programming modes available in the MachXO devices. On power-up, the SRAM is ready to be configured with IEEE 1149.1 serial TAP port using IEEE 1532 protocols.

Leave Alone I/O

When using IEEE 1532 mode for non-volatile memory programming, SRAM configuration, or issuing a refresh command, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reconfiguration or reprogramming occurs on-the-fly.

TransFR (Transparent Field Reconfiguration)

TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See TN1087, [Minimizing System Interruption During Configuration Using TransFR Technology](#) for details.

Security

The MachXO devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear the security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

MachXO Family Data Sheet

DC and Switching Characteristics

June 2013

Data Sheet DS1002

Absolute Maximum Ratings^{1, 2, 3}

	LCMXO E (1.2V)	LCMXO C (1.8V/2.5V/3.3V)
Supply Voltage V _{CC}	-0.5 to 1.32V	-0.5 to 3.75V
Supply Voltage V _{CCAUX}	-0.5 to 3.75V	-0.5 to 3.75V
Output Supply Voltage V _{CCIO}	-0.5 to 3.75V	-0.5 to 3.75V
I/O Tristate Voltage Applied ⁴	-0.5 to 3.75V	-0.5 to 3.75V
Dedicated Input Voltage Applied ⁴	-0.5 to 3.75V	-0.5 to 4.25V
Storage Temperature (ambient).....	-65 to 150°C	-65 to 150°C
Junction Temp. (T _j)	+125°C	+125°C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice *Thermal Management* document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to (V_{IHMAX} + 2) volts is permitted for a duration of <20ns.

Recommended Operating Conditions¹

Symbol	Parameter	Min.	Max.	Units
V _{CC}	Core Supply Voltage for 1.2V Devices	1.14	1.26	V
	Core Supply Voltage for 1.8V/2.5V/3.3V Devices	1.71	3.465	V
V _{CCAUX} ³	Auxiliary Supply Voltage	3.135	3.465	V
V _{CCIO} ²	I/O Driver Supply Voltage	1.14	3.465	V
t _{TJCOM}	Junction Temperature Commercial Operation	0	+85	°C
t _{TJIND}	Junction Temperature Industrial Operation	-40	100	°C
t _{TFLASHCOM}	Junction Temperature, Flash Programming, Commercial	0	+85	°C
t _{TFLASHIND}	Junction Temperature, Flash Programming, Industrial	-40	100	°C

1. Like power supplies must be tied together. For example, if V_{CCIO} and V_{CC} are both 2.5V, they must also be the same supply. 3.3V V_{CCIO} and 1.2V V_{CCIO} should be tied to V_{CCAUX} or 1.2V V_{CC} respectively.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CC} must reach minimum V_{CC} value before V_{CCAUX} reaches 2.5V.

MachXO Programming/Erase Specifications

1. The average DC current drawn by I/Os between GND connections, or between the last GND in an I/O Bank and the end of an I/O Bank, as shown in the logic signal connections table shall not exceed $n * 8\text{mA}$. Where n is the number of I/Os between Bank GND connections or between the last GND in a Bank and the end of a Bank.

Table 3-1. LVDS DC Conditions
Over Recommended Operating Conditions

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	Ω
R_S	Driver series resistor	294	Ω
R_P	Driver parallel resistor	121	Ω
R_T	Receiver termination	100	Ω
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100	Ω
I_{DC}	DC output current	3.66	mA

BLVDS

The MachXO family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMS outputs in conjunction with a parallel external resistor across the driver outputs. The input standard is supported by the LVDS differential input buffer on certain devices. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

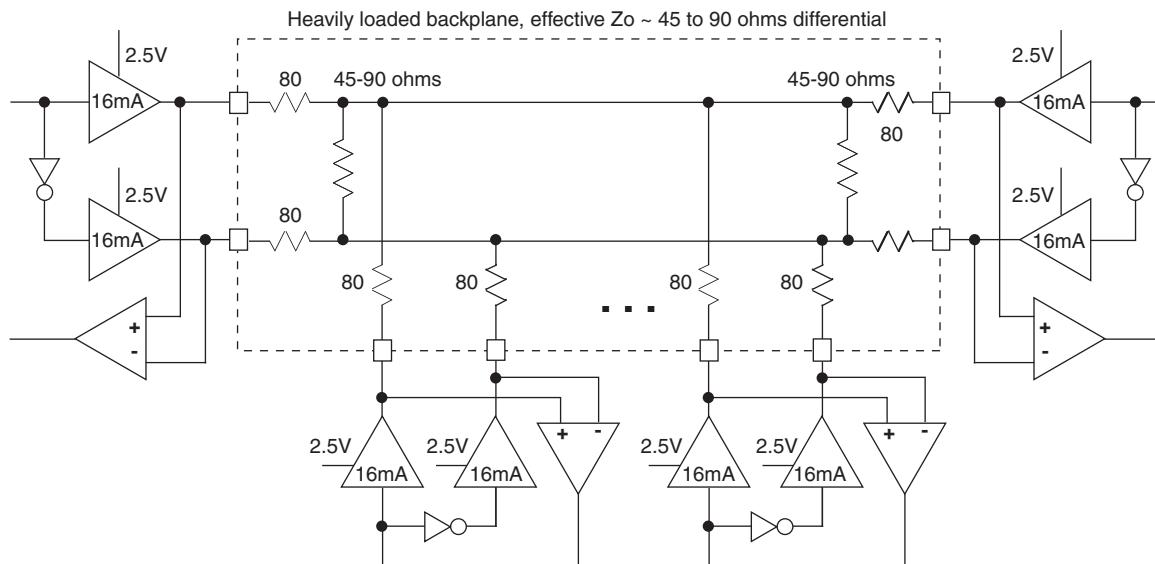

Figure 3-2. BLVDS Multi-point Output Example

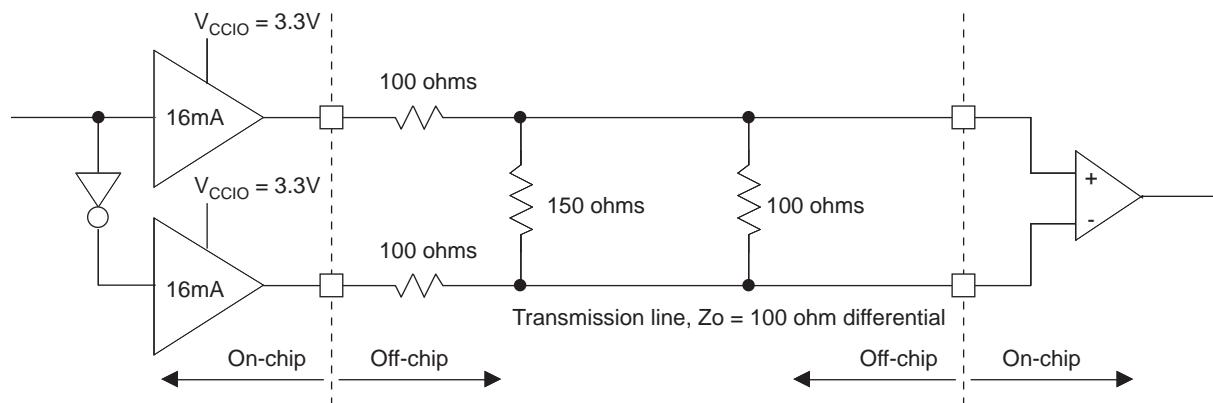

Table 3-2. BLVDS DC Conditions¹
Over Recommended Operating Conditions

Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
Z _{OUT}	Output impedance	100	100	Ohms
R _{TLEFT}	Left end termination	45	90	Ohms
R _{TRIGHT}	Right end termination	45	90	Ohms
V _{OH}	Output high voltage	1.375	1.48	V
V _{OL}	Output low voltage	1.125	1.02	V
V _{OD}	Output differential voltage	0.25	0.46	V
V _{CM}	Output common mode voltage	1.25	1.25	V
I _{DC}	DC output current	11.2	10.2	mA

1. For input buffer, see LVDS table.

LVPECL

The MachXO family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

Figure 3-3. Differential LVPECL

Table 3-3. LVPECL DC Conditions¹
Over Recommended Operating Conditions

Symbol	Description	Nominal	Units
Z _{OUT}	Output impedance	100	Ohms
R _P	Driver parallel resistor	150	Ohms
R _T	Receiver termination	100	Ohms
V _{OH}	Output high voltage	2.03	V
V _{OL}	Output low voltage	1.27	V
V _{OD}	Output differential voltage	0.76	V
V _{CM}	Output common mode voltage	1.65	V
Z _{BACK}	Back impedance	85.7	Ohms
I _{DC}	DC output current	12.7	mA

* Supports true LVDS outputs.

** NC for "E" devices.

*** Primary clock inputs are single-ended.

Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the [Thermal Management](#) document to find the device/package specific thermal values.

For Further Information

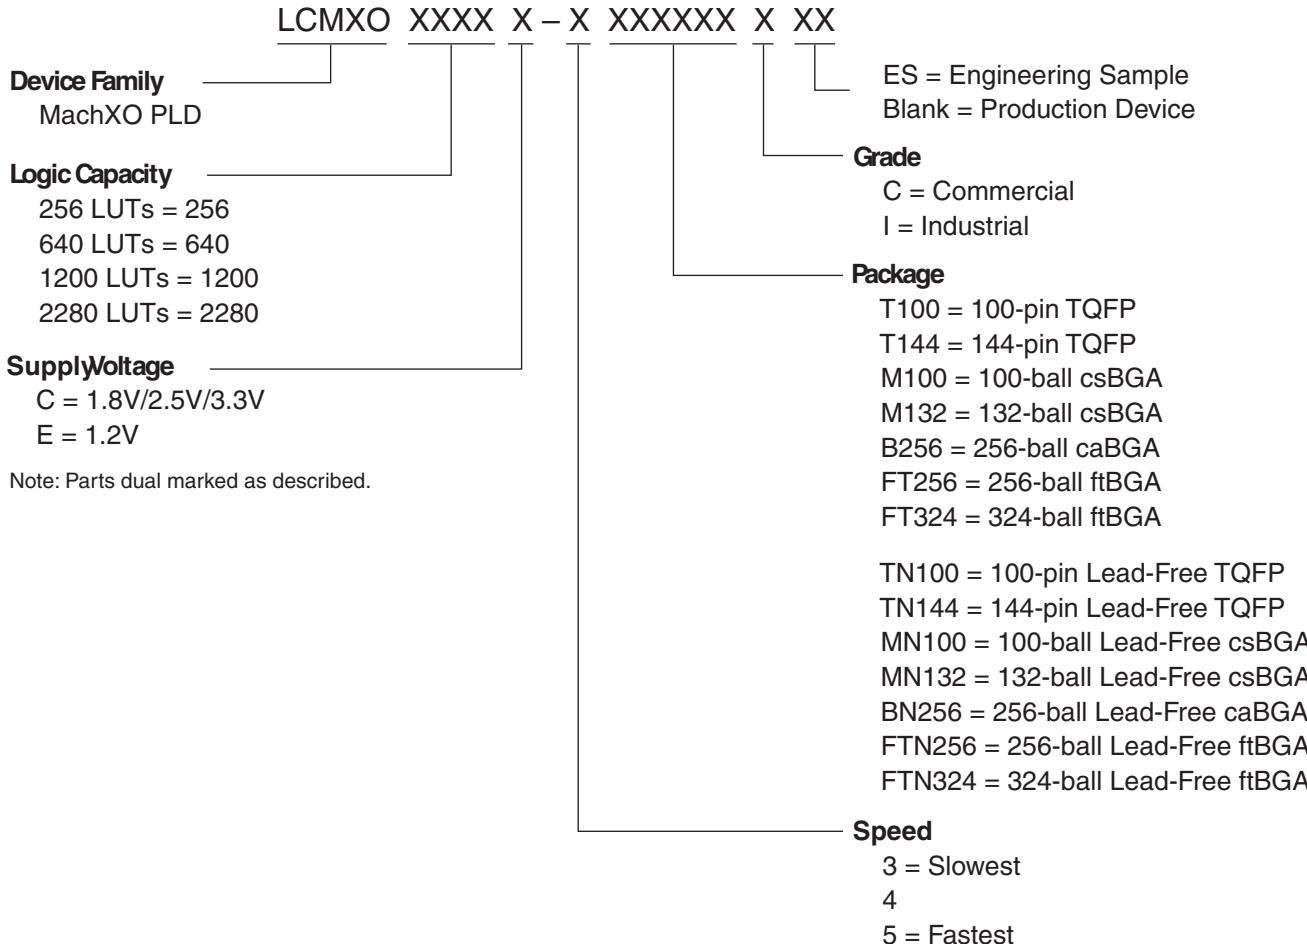

For further information regarding Thermal Management, refer to the following:

- [Thermal Management](#) document
- TN1090 - [Power Estimation and Management for MachXO Devices](#)
- Power Calculator tool included with the Lattice ispLEVER design tool, or as a standalone download from www.latticesemi.com/software

June 2013

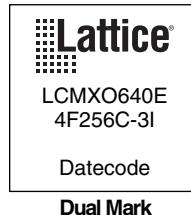

Data Sheet DS1002

Part Number Description

Ordering Information

Note: MachXO devices are dual marked except the slowest commercial speed grade device.
For example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.
The slowest commercial speed grade does not have industrial markings.
The markings appears as follows:

Part Number	LUTs	Supply Voltage	I/Os	Grade	Package	Pins	Temp.
LCMxo2280C-3T100C	2280	1.8V/2.5V/3.3V	73	-3	TQFP	100	COM

MachXO Family Data Sheet

Revision History

June 2013

Data Sheet DS1002

Revision History

Date	Version	Section	Change Summary
February 2005	01.0	—	Initial release.
October 2005	01.1	Introduction	Distributed RAM information in family table updated. Added footnote 1 - fpBGA packaging to the family selection guide.
		Architecture	sysIO Buffer section updated.
			Hot Socketing section updated.
			Sleep Mode section updated.
			SLEEP Pin Characteristics section updated.
			Oscillator section updated.
		DC and Switching Characteristics	Security section updated.
			Recommended Operating Conditions table updated.
			DC Electrical Characteristics table updated.
			Supply Current (Sleep Mode) table added with LCMXO256/640 data.
			Supply Current (Standby) table updated with LCMXO256/640 data.
			Initialization Supply Current table updated with LCMXO256/640 data.
			Programming and Erase Flash Supply Current table updated with LCMXO256/640 data.
			Register-to-Register Performance table updated (rev. A 0.16).
			External Switching Characteristics table updated (rev. A 0.16).
			Internal Timing Parameter table updated (rev. A 0.16).
			Family Timing Adders updated (rev. A 0.16).
			sysCLOCK Timingupdated (rev. A 0.16).
			MachXO "C" Sleep Mode Timing updated (A 0.16).
		Pinout Information	JTAG Port Timing Specification updated (rev. A 0.16).
			SLEEPIN description updated.
			Pin Information Summary updated.
			Power Supply and NC Connection table has been updated.
		Ordering Information	Logic Signal Connection section has been updated to include all devices/packages.
			Part Number Description section has been updated.
			Ordering Part Number section has been updated (added LCMXO256C/ LCMXO640C "4W").
		Supplemental Information	MachXO Density Migration Technical Note (TN1097) added.
November 2005	01.2	Pinout Information	Added "Power Supply and NC Connections" summary information for LCMXO1200 and LCMXO2280 in 100 TQFP package.
December 2005	01.3	DC and Switching Characteristics	Supply Current (Standby) table updated with LCMXO1200/2280 data.
		Ordering Information	Ordering Part Number section updated (added LCMXO2280C "4W").
April 2006	02.0	Introduction	Introduction paragraphs updated.
		Architecture	Architecture Overview paragraphs updated.
