## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### Details

Product Status	Active
Number of LABs/CLBs	150
Number of Logic Elements/Cells	1200
Total RAM Bits	9421
Number of I/O	73
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo1200c-4tn100i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo1200c-4tn100i</a>

### Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM, and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

**Table 2-2. Slice Modes**

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

**Logic Mode:** In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables (LUT4). A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7, and LUT8 can be constructed by concatenating other Slices.

**Ripple Mode:** Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals, Carry Generate and Carry Propagate, are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

**RAM Mode:** In this mode, distributed RAM can be constructed using each LUT block as a 16x2-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The ispLEVER design tool supports the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of Slices required to implement different distributed RAM primitives. Figure 2-6 shows the distributed memory primitive block diagrams. Dual port memories involve the pairing of two Slices. One Slice functions as the read-write port, while the other companion Slice supports the read-only port. For more information on RAM mode in MachXO devices, please see details of additional technical documentation at the end of this data sheet.

**Table 2-3. Number of Slices Required For Implementing Distributed RAM**

	SPR16x2	DPR16x2
Number of Slices	1	2

Note: SPR = Single Port RAM, DPR = Dual Port RAM

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – a copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – when new data is being written, the old contents of the address appears at the output. This mode is supported for x9, x18 and x36 data widths.

#### FIFO Configuration

The FIFO has a write port with Data-in, CEW, WE and CLKW signals. There is a separate read port with Data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. The range of programming values for these flags are in Table 2-7.

**Table 2-7. Programmable FIFO Flag Ranges**

Flag Name	Programming Range
Full (FF)	1 to (up to $2^N-1$ )
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

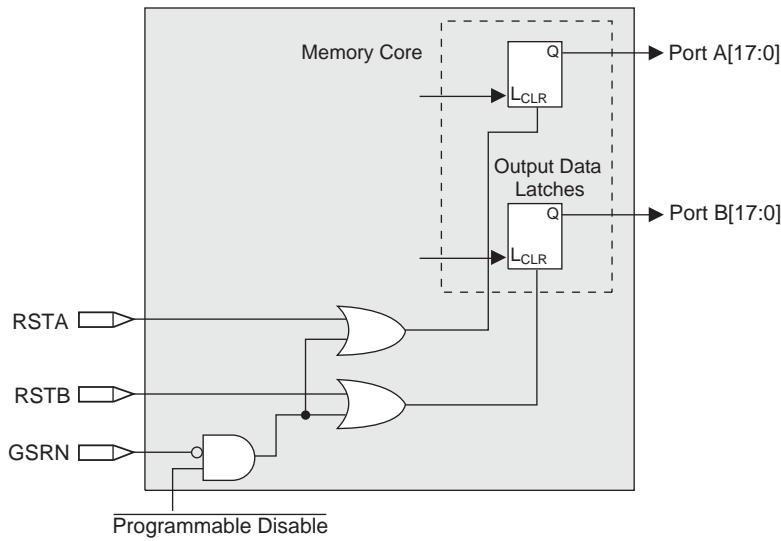

N = Address bit width

The FIFO state machine supports two types of reset signals: RSTA and RSTB. The RSTA signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset state. The RSTB signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

#### Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-13.

**Figure 2-13. Memory Core Reset**

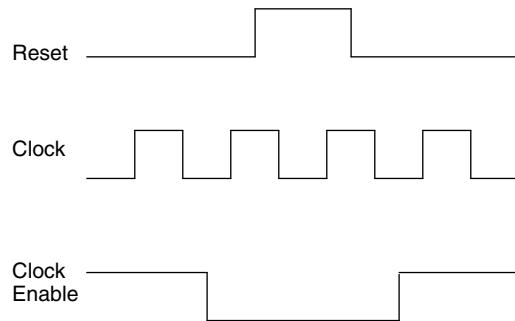

For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

#### EGR Asynchronous Reset

EGR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EGR is always asynchronous.

**Figure 2-14. EGR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EGR asynchronous reset or GSR may only be applied and released after the EGR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EGR clock). The reset release must adhere to the EGR synchronous reset setup time before the next active read or write clock edge.

If an EGR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EGR RAM, ROM and FIFO implementations. For the EGR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EGR inputs.

Note that there are no reset restrictions if the EGR synchronous reset is used and the EGR GSR input is disabled

of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$ , and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

## 2. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

### Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when  $V_{CC}$  and  $V_{CCAUX}$  have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all  $V_{CCIO}$  Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to  $V_{CCIO}$ . The I/O pins will maintain the blank configuration until  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

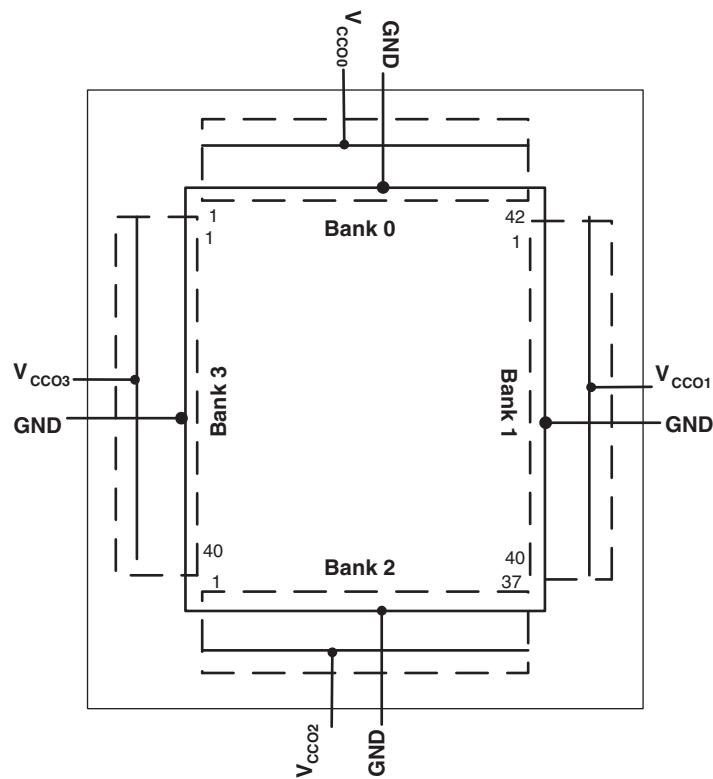

The  $V_{CC}$  and  $V_{CCAUX}$  supply the power to the FPGA core fabric, whereas the  $V_{CCIO}$  supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore,  $V_{CCIO}$  supplies should be powered up before or together with the  $V_{CC}$  and  $V_{CCAUX}$  supplies

### Supported Standards

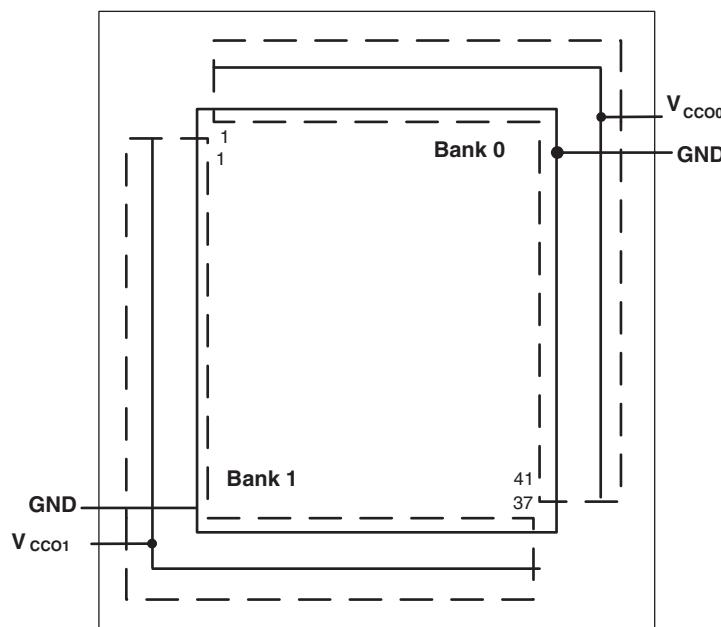

The MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTL. The buffer supports the LVTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The MachXO1200 and MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of MachXO1200 and MachXO2280 devices. PCI support is provided in the top Banks of the MachXO1200 and MachXO2280 devices. Table 2-8 summarizes the I/O characteristics of the devices in the MachXO family.

Tables 2-9 and 2-10 show the I/O standards (together with their supply and reference voltages) supported by the MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

**Figure 2-20. MachXO640 Banks**

**Figure 2-21. MachXO256 Banks**

## Hot Socketing

The MachXO devices have been carefully designed to ensure predictable behavior during power-up and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of

## MachXO Internal Timing Parameters<sup>1</sup>

Over Recommended Operating Conditions

Parameter	Description	-5		-4		-3		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
<b>PFU/PFF Logic Mode Timing</b>

1. Pin orientation follows the conventional order from pin 1 marking of the top side view and counter-clockwise.
2. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
3. All grounds must be electrically connected at the board level. For fpBGA and ftBGA packages, the total number of GND balls is less than the actual number of GND logic connections from the die to the common package GND plane.
4. NC pins should not be connected to any active signals, VCC or GND.

\* Supports true LVDS outputs.

\*\* NC for "E" devices.

\*\*\* Primary clock inputs are single-ended.

## Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the [Thermal Management](#) document to find the device/package specific thermal values.

## For Further Information

For further information regarding Thermal Management, refer to the following:

- [Thermal Management](#) document
- TN1090 - [Power Estimation and Management for MachXO Devices](#)
- Power Calculator tool included with the Lattice ispLEVER design tool, or as a standalone download from [www.latticesemi.com/software](http://www.latticesemi.com/software)

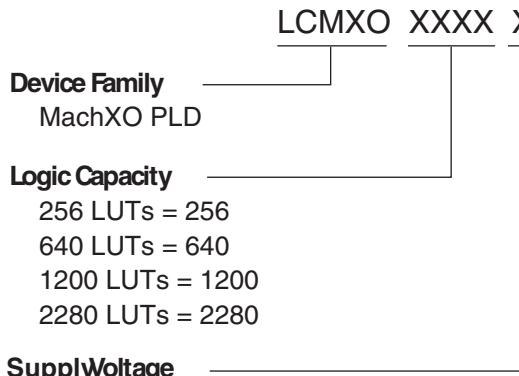

# MachXO Family Data Sheet Ordering Information

June 2013

Data Sheet DS1002

## **Part Number Description**

Note: Parts dual marked as described.

ES = Engineering Sample  
Blank = Production Device

Grade

C = Commercial  
I = Industrial

## Package

T100 = 100-pin TQFP  
T144 = 144-pin TQFP  
M100 = 100-ball csBGA  
M132 = 132-ball csBGA  
B256 = 256-ball caBGA  
FT256 = 256-ball ftBGA  
FT324 = 324-ball ftBGA

TN100 = 100-pin Lead-Free TQFP  
TN144 = 144-pin Lead-Free TQFP  
MN100 = 100-ball Lead-Free csBGA  
MN132 = 132-ball Lead-Free csBGA  
BN256 = 256-ball Lead-Free caBGA  
FTN256 = 256-ball Lead-Free ftBGA  
FTN324 = 324-ball Lead-Free ftBGA

## Speed

3 = Slowest  
4  
5 = Fastest

## **Ordering Information**

Note: MachXO devices are dual marked except the slowest commercial speed grade device.  
For example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.  
The slowest commercial speed grade does not have industrial markings.  
The markings appears as follows:

Part Number	LUTs	Supply Voltage	I/Os	Grade	Package	Pins	Temp.
LCMxo2280C-3TN100C	2280	1.8V/2.5V/3.3V	73	-3	Lead-Free TQFP	100	COM
LCMxo2280C-4TN100C	2280	1.8V/2.5V/3.3V	73	-4	Lead-Free TQFP	100	COM

# MachXO Family Data Sheet

## Supplemental Information

---

June 2013

Data Sheet DS1002

### For Further Information

A variety of technical notes for the MachXO family are available on the Lattice web site.

- TN1091, [MachXO sysIO Usage Guide](#)
- TN1089, [MachXO sysCLOCK Design and Usage Guide](#)
- TN1092, [Memory Usage Guide for MachXO Devices](#)
- TN1090, [Power Estimation and Management for MachXO Devices](#)
- TN1086, [MachXO JTAG Programming and Configuration User's Guide](#)
- TN1087, [Minimizing System Interruption During Configuration Using TransFR Technology](#)
- TN1097, [MachXO Density Migration](#)
- AN8066, [Boundary Scan Testability with Lattice sysIO Capability](#)

For further information on interface standards refer to the following web sites:

- JEDEC Standards (LVTTL, LVCMOS): [www.jedec.org](#)
- PCI: [www.pcisig.com](#)
