Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	150
Number of Logic Elements/Cells	1200
Total RAM Bits	9421
Number of I/O	101
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (Tj)
Package / Case	132-LFBGA, CSPBGA
Supplier Device Package	132-CSPBGA (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo1200e-3mn132c

Architecture Overview

The MachXO family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). Some devices in this family have sysCLOCK PLLs and blocks of sysMEM™ Embedded Block RAM (EBRs). Figures 2-1, 2-2, and 2-3 show the block diagrams of the various family members.

The logic blocks are arranged in a two-dimensional grid with rows and columns. The EBR blocks are arranged in a column to the left of the logic array. The PIO cells are located at the periphery of the device, arranged into Banks. The PIOs utilize a flexible I/O buffer referred to as a sysIO interface that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and the Programmable Functional unit without RAM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PFF block contains building blocks for logic, arithmetic, ROM, and register functions. Both the PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and effectively. Logic blocks are arranged in a two-dimensional array. Only one type of block is used per row.

In the MachXO family, the number of sysIO Banks varies by device. There are different types of I/O Buffers on different Banks. See the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks; these blocks are found only in the larger devices. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT use.

The MachXO registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO architecture provides up to two sysCLOCK™ Phase Locked Loop (PLL) blocks on larger devices. These blocks are located at either end of the memory blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a JTAG Port that supports programming and configuration of the device as well as access to the user logic. The MachXO devices are available for operation from 3.3V, 2.5V, 1.8V, and 1.2V power supplies, providing easy integration into the overall system.

sysCLOCK Phase Locked Loops (PLLs)

The MachXO1200 and MachXO2280 provide PLL support. The source of the PLL input divider can come from an external pin or from internal routing. There are four sources of feedback signals to the feedback divider: from CLKINTFB (internal feedback port), from the global clock nets, from the output of the post scalar divider, and from the routing (or from an external pin). There is a PLL_LOCK signal to indicate that the PLL has locked on to the input clock signal. Figure 2-10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the t_{LOCK} parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider, and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

Figure 2-10. PLL Diagram

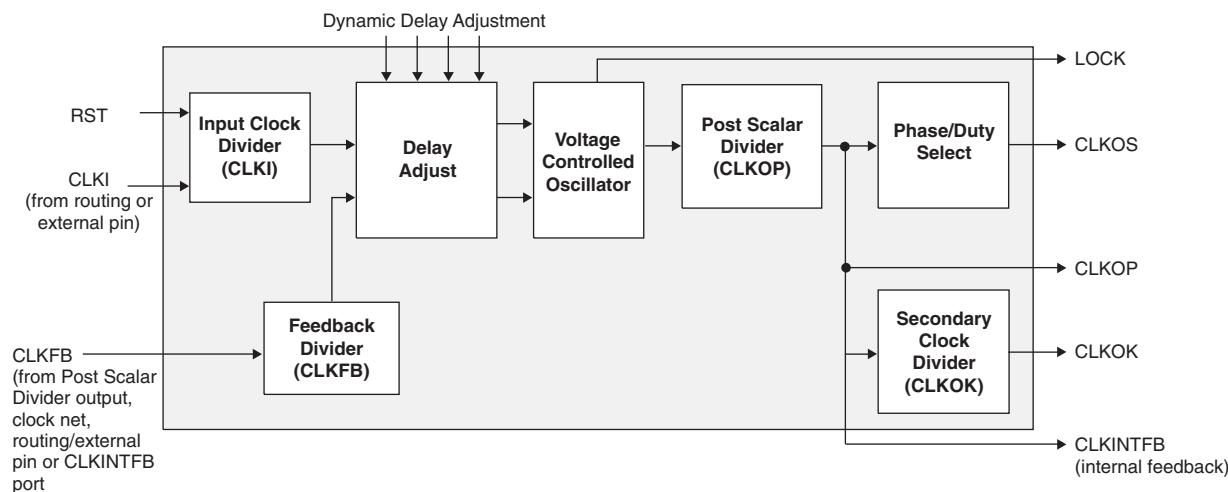

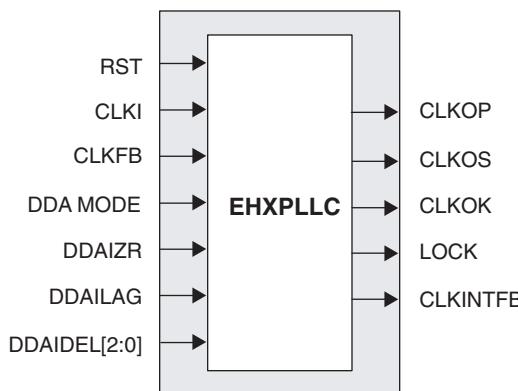

Figure 2-11 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

Figure 2-11. PLL Primitive

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – a copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – when new data is being written, the old contents of the address appears at the output. This mode is supported for x9, x18 and x36 data widths.

FIFO Configuration

The FIFO has a write port with Data-in, CEW, WE and CLKW signals. There is a separate read port with Data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. The range of programming values for these flags are in Table 2-7.

Table 2-7. Programmable FIFO Flag Ranges

Flag Name	Programming Range
Full (FF)	1 to (up to 2^N-1)
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

N = Address bit width

The FIFO state machine supports two types of reset signals: RSTA and RSTB. The RSTA signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset state. The RSTB signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 2-13.

of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after V_{CC} , V_{CCAUX} , and V_{CCIO} are at valid operating levels and the device has been configured.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

2. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all V_{CCIO} Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to V_{CCIO} . The I/O pins will maintain the blank configuration until V_{CC} , V_{CCAUX} and V_{CCIO} have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore, V_{CCIO} supplies should be powered up before or together with the V_{CC} and V_{CCAUX} supplies

Supported Standards

The MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTL. The buffer supports the LVTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The MachXO1200 and MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of MachXO1200 and MachXO2280 devices. PCI support is provided in the top Banks of the MachXO1200 and MachXO2280 devices. Table 2-8 summarizes the I/O characteristics of the devices in the MachXO family.

Tables 2-9 and 2-10 show the I/O standards (together with their supply and reference voltages) supported by the MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

Initialization Supply Current^{1, 2, 3, 4}

Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. ⁵	Units
I _{CC}	Core Power Supply	LCMxo256C	13	mA
		LCMxo640C	17	mA
		LCMxo1200C	21	mA

LCMxo1200C-3FTN256I	1200	1.8V/2.5V/3.3V	211	-3	Lead-Free ftBGA	256	IND
LCMxo1200C-4FTN256I	1200	1.8V/2.5V/3.3V	211	-4	Lead-Free ftBGA	256	IND

Part Number	LUTs	Supply Voltage	I/Os	Grade	Package	Pins	Temp.
LCMxo2280C-3TN100I	2280	1.8V/2.5V/3.3V	73	-3	Lead-Free TQFP	100	IND
LCMxo2280C-4TN100I	2280	1.8V/2.5V/3.3V	73	-4	Lead-Free TQFP	100	IND
LCMxo2280C-3TN144I	2280	1.8V/2.5V/3.3V	113	-3	Lead-Free TQFP	144	IND
LCMxo2280C-4TN144I	2280	1.8V/2.5V/3.3V	113	-4	Lead-Free TQFP	144	IND
LCMxo2280C-3MN132I	2280	1.8V/2.5V/3.3V	101	-3	Lead-Free csBGA	132	IND
LCMxo2280C-4MN132I	2280	1.8V/2.5V/3.3V	101	-4	Lead-Free csBGA	132	IND
LCMxo2280C-3BN256I	2280	1.8V/2.5V/3.3V	211	-3	Lead-Free caBGA	256	IND
LCMxo2280C-4BN256I	2280	1.8V/2.5V/3.3V	211	-4	Lead-Free caBGA	256	IND
LCMxo2280C-3FTN256I	2280	1.8V/2.5V/3.3V	211	-3	Lead-Free ftBGA	256	IND
LCMxo2280C-4FTN256I	2280	1.8V/2.5V/3.3V	211	-4	Lead-Free ftBGA	256	IND
LCMxo2280C-3FTN324I	2280	1.8V/2.5V/3.3V	271	-3	Lead-Free ftBGA	324	IND
LCMxo2280C-4FTN324I	2280	1.8V/2.5V/3.3V	271	-4	Lead-Free ftBGA	324	IND

Date	Version	Section	Change Summary
April 2006 (cont.)	02.0 (cont.)	Architecture (cont.)	<p>"Top View of the MachXO1200 Device" figure updated.</p> <p>"Top View of the MachXO640 Device" figure updated.</p> <p>"Top View of the MachXO256 Device" figure updated.</p> <p>"Slice Diagram" figure updated.</p> <p>Slice Signal Descriptions table updated.</p> <p>Routing section updated.</p> <p>sysCLOCK Phase Locked Loops (PLLs) section updated.</p> <p>PLL Diagram updated.</p> <p>PLL Signal Descriptions table updated.</p> <p>sysMEM Memory section has been updated.</p> <p>PIO Groups section has been updated.</p> <p>PIO section has been updated.</p> <p>MachXO PIO Block Diagram updated.</p> <p>Supported Input Standards table updated.</p> <p>MachXO Configuration and Programming diagram updated.</p>
		DC and Switching Characteristics	<p>Recommended Operating Conditions table - footnotes updated.</p> <p>MachXO256 and MachXO640 Hot Socketing Specifications - footnotes updated.</p> <p>Added MachXO1200 and MachXO2280 Hot Socketing Specifications table.</p> <p>DC Electrical Characteristics, footnotes have been updated.</p> <p>Supply Current (Sleep Mode) table has been updated, removed "4W" references. Footnotes have been updated.</p> <p>Supply Current (Standby) table and associated footnotes updated.</p> <p>Initialization Supply Current table and footnotes updated.</p> <p>Programming and Erase Flash Supply Current table and associated footnotes have been updated.</p> <p>Register-to-Register Performance table updated (rev. A 0.19).</p> <p>MachXO External Switching Characteristics updated (rev. A 0.19).</p> <p>MachXO Internal Timing Parameters updated (rev. A 0.19).</p> <p>MachXO Family Timing Adders updated (rev. A 0.19).</p> <p>sysCLOCK Timing updated (rev. A 0.19).</p> <p>MachXO "C" Sleep Mode Timing updated (A 0.19).</p> <p>JTAG Port Timing Specification updated (rev. A 0.19).</p> <p>Test Fixture Required Components table updated.</p>
		Pinout Information	<p>Signal Descriptions have been updated.</p> <p>Pin Information Summary has been updated. Footnote has been added.</p> <p>Power Supply and NC Connection table has been updated.</p> <p>Logic Signal Connections have been updated (PCLKTx_x --> PCLKx_x)</p>
		Ordering Information	<p>Removed "4W" references.</p> <p>Added 256-ftBGA Ordering Part Numbers for MachXO640.</p>
May 2006	02.1	Pinout Information	<p>Removed [LOC][0]_PLL_RST from Signal Description table.</p> <p>PCLK footnote has been added to all appropriate pins.</p>
August 2006	02.2	Multiple	Removed 256 fpBGA information for MachXO640.
