Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

MachXO Family Data Sheet
Introduction

Features

■ **Non-volatile, Infinitely Reconfigurable**
  • Instant-on – powers up in microseconds
  • Single chip, no external configuration memory required
  • Excellent design security, no bit stream to intercept
  • Reconfigure SRAM based logic in milliseconds
  • SRAM and non-volatile memory programmable through JTAG port
  • Supports background programming of non-volatile memory

■ **Sleep Mode**
  • Allows up to 100x static current reduction

■ **TransFR™ Reconfiguration (TFR)**
  • In-field logic update while system operates

■ **High I/O to Logic Density**
  • 256 to 2280 LUT4s
  • 73 to 271 I/Os with extensive package options
  • Density migration supported
  • Lead free/RoHS compliant packaging

■ **Embedded and Distributed Memory**
  • Up to 27.6 Kbits sysMEM™ Embedded Block RAM
  • Up to 7.7 Kbits distributed RAM
  • Dedicated FIFO control logic

■ **Flexible I/O Buffer**
  • Programmable sysIO™ buffer supports wide range of interfaces:
    − LVCMOS 3.3/2.5/1.8/1.5/1.2
    − LVTTL
    − PCI
    − LVDS, Bus-LVDS, LVPECL, RSDS

■ **sysCLOCK™ PLLs**
  • Up to two analog PLLs per device
  • Clock multiply, divide, and phase shifting

■ **System Level Support**
  • IEEE Standard 1149.1 Boundary Scan
  • Onboard oscillator
  • Devices operate with 3.3V, 2.5V, 1.8V or 1.2V power supply
 • IEEE 1532 compliant in-system programming

Introduction

The MachXO is optimized to meet the requirements of applications traditionally addressed by CPLDs and low capacity FPGAs: glue logic, bus bridging, bus interfacing, power-up control, and control logic. These devices bring together the best features of CPLD and FPGA devices on a single chip.

The ispLEVER design tool takes the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

The MachXO family of devices provides global signals that are available to all PFUs. These signals consist of four primary clocks and four secondary clocks. Primary clock signals are generated from four 16:1 muxes as shown in Figure 2-7 and Figure 2-8. The available clock sources for the MachXO256 and MachXO640 devices are four dual function clock pins and 12 internal routing signals. The available clock sources for the MachXO1200 and MachXO2280 devices are four dual function clock pins, up to nine internal routing signals and up to six PLL outputs.

Hot Socketing

The MachXO devices have been carefully designed to ensure predictable behavior during power-up and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of

the system. These capabilities make the MachXO ideal for many multiple power supply and hot-swap applications.

Sleep Mode

The MachXO "C" devices (V_{CC} = 1.8/2.5/3.3V) have a sleep mode that allows standby current to be reduced dramatically during periods of system inactivity. Entry and exit to Sleep mode is controlled by the SLEEPN pin.

During Sleep mode, the logic is non-operational, registers and EBR contents are not maintained, and I/Os are tri-stated. Do not enter Sleep mode during device programming or configuration operation. In Sleep mode, power supplies are in their normal operating range, eliminating the need for external switching of power supplies. Table 2-11 compares the characteristics of Normal, Off and Sleep modes.

Table 2-11. Characteristics of Normal, Off and Sleep Modes

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static Icc	Typical <10mA	0	Typical <100uA
I/O Leakage	<10μA	<1mA	<10μA
Power Supplies VCC/VCCIO/VCCAUX	Normal Range	0	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the VCC supply for the device. This pin also has a weak pull-up, along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to VCC is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically, the device enters sleep mode several hundred nanoseconds after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet shows a detailed timing diagram.

Oscillator

Every MachXO device has an internal CMOS oscillator. The oscillator can be routed as an input clock to the clock tree or to general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit to enable/disable the oscillator. The oscillator frequency ranges from 18MHz to 26MHz.

Configuration and Testing

The following section describes the configuration and testing features of the MachXO family of devices.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with one of the VCCIO Banks (MachXO256: V_{CCIO1}; MachXO640: V_{CCIO2}; MachXO1200 and MachXO2280: V_{CCIO5}) and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. T_A 25°C, f = 1.0MHz
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. Not applicable to SLEEPN pin.
5. When V_{IH} is higher than V_{CCIO}, a transient current typically of 30ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For MachXO1200 and MachXO2280 true LVDS output pins, V_{IH} must be less than or equal to V_{CCIO}.

RSDS

The MachXO family supports the differential RSDS standard. The output standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.
