Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

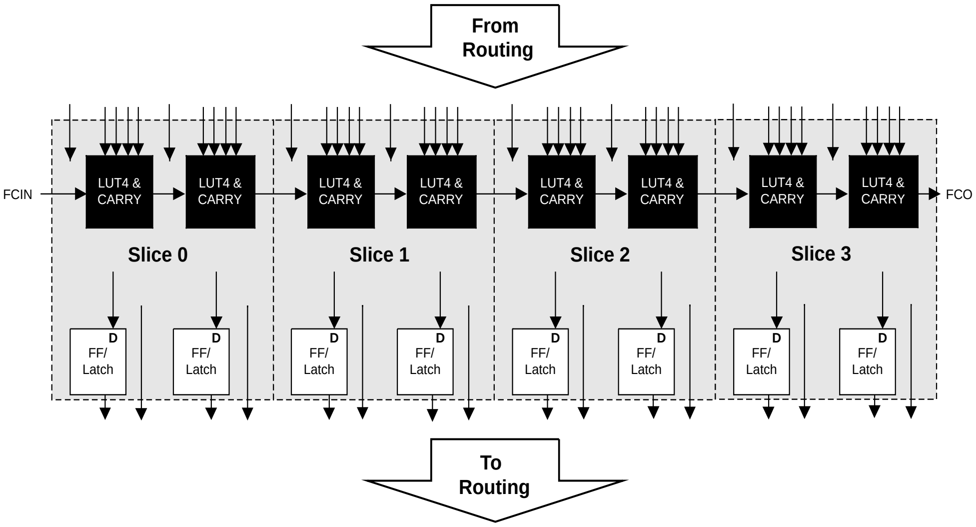
PFU Blocks

The core of the MachXO devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM, and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic, and Distributed ROM functions. Except where necessary, the remainder of this data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected Slices, numbered 0-3 as shown in Figure 2-4. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-4. PFU Diagram



Slice

Each Slice contains two LUT4 lookup tables feeding two registers (programmed to be in FF or Latch mode), and some associated logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7, and LUT8. There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select, and wider RAM/ROM functions. Figure 2-5 shows an overview of the internal logic of the Slice. The registers in the Slice can be configured for positive/negative and edge/level clocks.

PIO Groups

On the MachXO devices, PIO cells are assembled into two different types of PIO groups, those with four PIO cells and those with six PIO cells. PIO groups with four IOs are placed on the left and right sides of the device while PIO groups with six IOs are placed on the top and bottom. The individual PIO cells are connected to their respective sysIO buffers and PADs.

On all MachXO devices, two adjacent PIOs can be joined to provide a complementary Output driver pair. The I/O pin pairs are labeled as "T" and "C" to distinguish between the true and complement pins.

The MachXO1200 and MachXO2280 devices contain enhanced I/O capability. All PIO pairs on these larger devices can implement differential receivers. In addition, half of the PIO pairs on the left and right sides of these devices can be configured as LVDS transmit/receive pairs. PIOs on the top of these larger devices also provide PCI support.

Figure 2-15. Group of Four Programmable I/O Cells

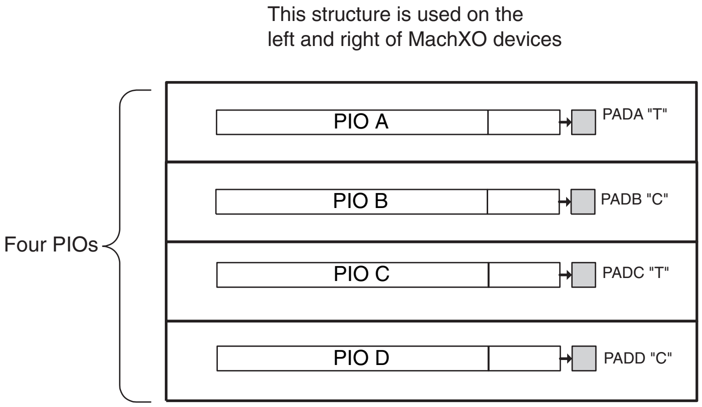


Figure 2-16. Group ofþSix Programmable I/O Cells

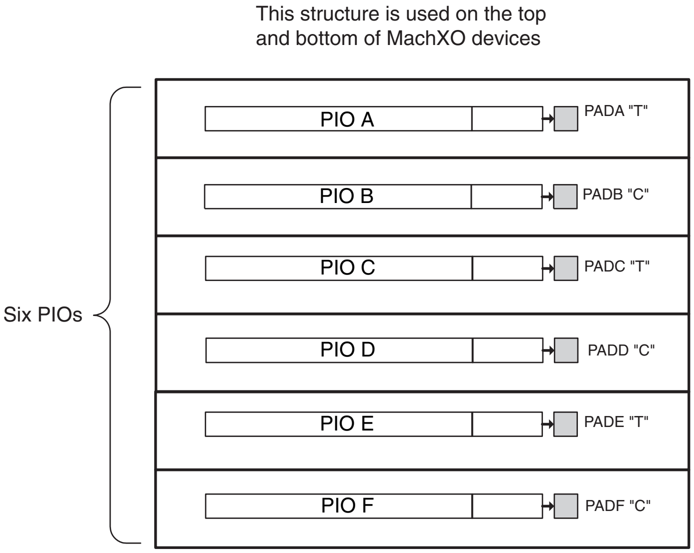

PIO

The PIO blocks provide the interface between the sysIO buffers and the internal PFU array blocks. These blocks receive output data from the PFU array and a fast output data signal from adjacent PFUs. The output data and fast the system. These capabilities make the MachXO ideal for many multiple power supply and hot-swap applications.

Sleep Mode

The MachXO "C" devices (V_{CC} = 1.8/2.5/3.3V) have a sleep mode that allows standby current to be reduced dramatically during periods of system inactivity. Entry and exit to Sleep mode is controlled by the SLEEPN pin.

During Sleep mode, the logic is non-operational, registers and EBR contents are not maintained, and I/Os are tri-stated. Do not enter Sleep mode during device programming or configuration operation. In Sleep mode, power supplies are in their normal operating range, eliminating the need for external switching of power supplies. Table 2-11 compares the characteristics of Normal, Off and Sleep modes.

Table 2-11. Characteristics of Normal, Off and Sleep Modes

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static Icc	Typical <10mA	0	Typical <100uA
I/O Leakage	<10µA	<1mA	<10µA
Power Supplies VCC/VCCIO/VCCAUX	Normal Range	0	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the VCC supply for the device. This pin also has a weak pull-up, along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to VCC is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically, the device enters sleep mode several hundred nanoseconds after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet shows a detailed timing diagram.

Oscillator

Every MachXO device has an internal CMOS oscillator. The oscillator can be routed as an input clock to the clock tree or to general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit to enable/disable the oscillator. The oscillator frequency ranges from 18MHz to 26MHz.

Configuration and Testing

The following section describes the configuration and testing features of the MachXO family of devices.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with one of the VCCIO Banks (MachXO256: V_{CCIO1}; MachXO640: V_{CCIO2}; MachXO1200 and MachXO2280: V_{CCIO5}) and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. T_A 25°C, f = 1.0MHz
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. Not applicable to SLEEPN pin.
5. When V_{IH} is higher than V_{CCIO}, a transient current typically of 30ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For MachXO1200 and MachXO2280 true LVDS output pins, V_{IH} must be less than or equal to V_{CCIO}.

BLVDS

The MachXO family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. The input standard is supported by the LVDS differential input buffer on certain devices. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Part Number Description

LCMXO XXXX X – X XXXXXX X XX

Device Family
MachXO PLD

Logic Capacity
256 LUTs = 256
640 LUTs = 640
1200 LUTs = 1200
2280 LUTs = 2280

Supply Voltage
C = 1.8V/2.5V/3.3V
E = 1.2V

Note: Parts dual marked as described.

Ordering Information

Note: MachXO devices are dual marked except the slowest commercial speed grade device.þFor example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.þThe slowest commercial speed grade does not have industrial markings.þ The markings appears as follows:

Date	Version	Section	Change Summary
April 2006 (cont.)	02.0 (cont.)	Architecture (cont.)	"Top View of the MachXO1200 Device" figure updated.
			"Top View of the MachXO640 Device" figure updated.
			"Top View of the MachXO256 Device" figure updated.
			"Slice Diagram" figure updated.
			Slice Signal Descriptions table updated.
			Routing section updated.
			sysCLOCK Phase Lockecd Loops (PLLs) section updated.
			PLL Diagram updated.
			PLL Signal Descriptions table updated.
			sysMEM Memory section has been updated.
			PIO Groups section has been updated.
			PIO section has been updated.
			MachXO PIO Block Diagram updated.
			Supported Input Standards table updated.
			MachXO Configuration and Programming diagram updated.
		DC and Switching Characteristics	Recommended Operating Conditions table - footnotes updated.
			MachXO256 and MachXO640 Hot Socketing Specifications - footnotes updated.
			Added MachXO1200 and MachXO2280 Hot Socketing Specifications table.
			DC Electrical Characteristics, footnotes have been updated.
			Supply Current (Sleep Mode) table has been updated, removed "4W" references. Footnotes have been updated.
			Supply Current (Standby) table and associated footnotes updated.
			Intialization Supply Current table and footnotes updated.
			Programming and Erase Flash Supply Current table and associated footnotes have been updatd.
			Register-to-Register Performance table updated (rev. A 0.19).
			MachXO External Switching Characteristics updated (rev. A 0.19).
			MachXO Internal Timing Parameters updated (rev. A 0.19).
			MachXO Family Timing Adders updated (rev. A 0.19).
			sysCLOCK Timing updated (rev. A 0.19).
			MachXO "C" Sleep Mode Timing updated (A 0.19).
			JTAG Port Timing Specification updated (rev. A 0.19).
			Test Fixture Required Components table updated.
		Pinout Information	Signal Descriptions have been updated.
			Pin Information Summary has been updated. Footnote has been added.
			Power Supply and NC Connection table has been updated.
			Logic Signal Connections have been updated (PCLKTx_x --> PCLKx_x)
		Ordering Information	Removed "4W" references.
			Added 256-ftBGA Ordering Part Numbers for MachXO640.
May 2006	02.1	Pinout Information	Removed [LOC][0]_PLL_RST from Signal Description table.
			PCLK footnote has been added to all appropriate pins.
August 2006	02.2	Multiple	Removed 256 fpBGA information for MachXO640.
