
Understanding Embedded - FPGAs (Field Programmable Gate Array)

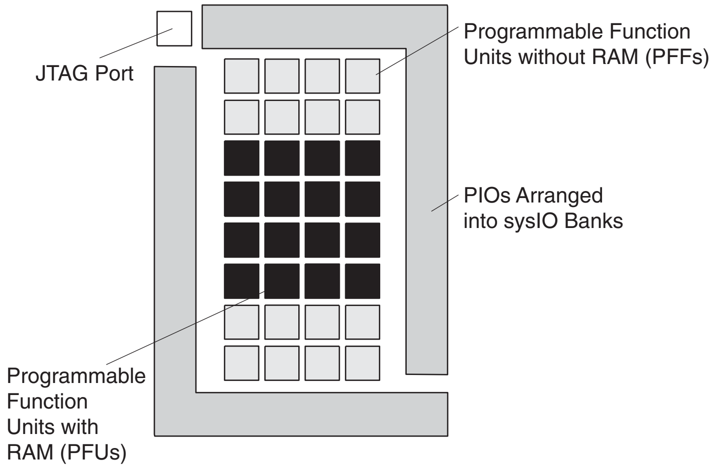
Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	285
Number of Logic Elements/Cells	2280
Total RAM Bits	28262
Number of I/O	211
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-LFBGA, CSPBGA
Supplier Device Package	256-CABGA (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo2280e-4b256i

Figure 2-3. Top View of the MachXO256 Device

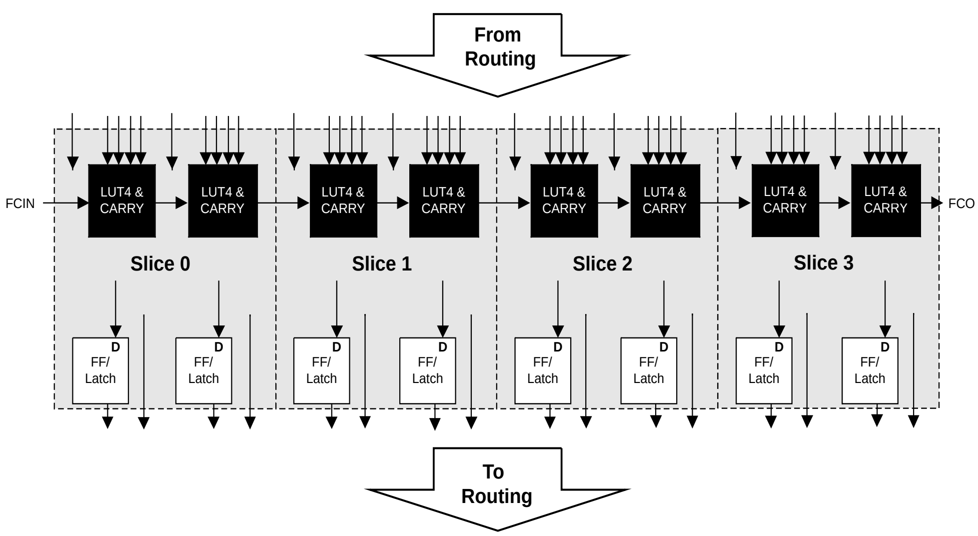


PFU Blocks

The core of the MachXO devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM, and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic, and Distributed ROM functions. Except where necessary, the remainder of this data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected Slices, numbered 0-3 as shown in Figure 2-4. There are 53 inputs and 25 outputs associated with each PFU block.

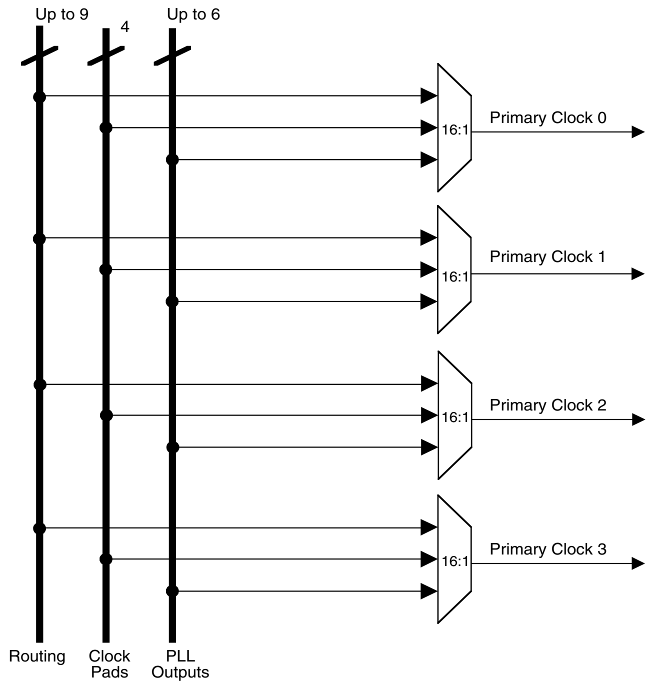
Figure 2-4. PFU Diagram



Slice

Each Slice contains two LUT4 lookup tables feeding two registers (programmed to be in FF or Latch mode), and some associated logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7, and LUT8. There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select, and wider RAM/ROM functions. Figure 2-5 shows an overview of the internal logic of the Slice. The registers in the Slice can be configured for positive/negative and edge/level clocks.

Figure 2-8. Primary Clocks for MachXO1200 and MachXO2280 Devices



Four secondary clocks are generated from four 16:1 muxes as shown in Figure 2-9. Four of the secondary clock sources come from dual function clock pins and 12 come from internal routing.

Figure 2-9. Secondary Clocks for MachXO Devices

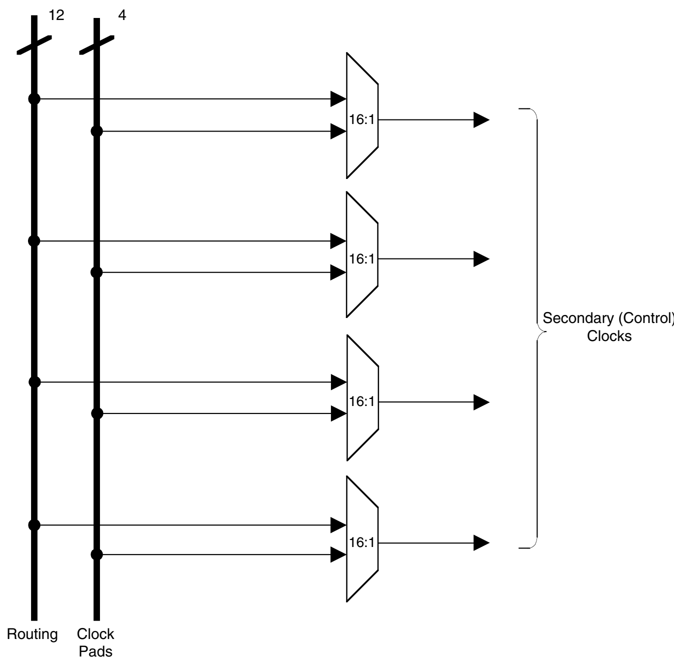


Figure 2-13. Memory Core Reset

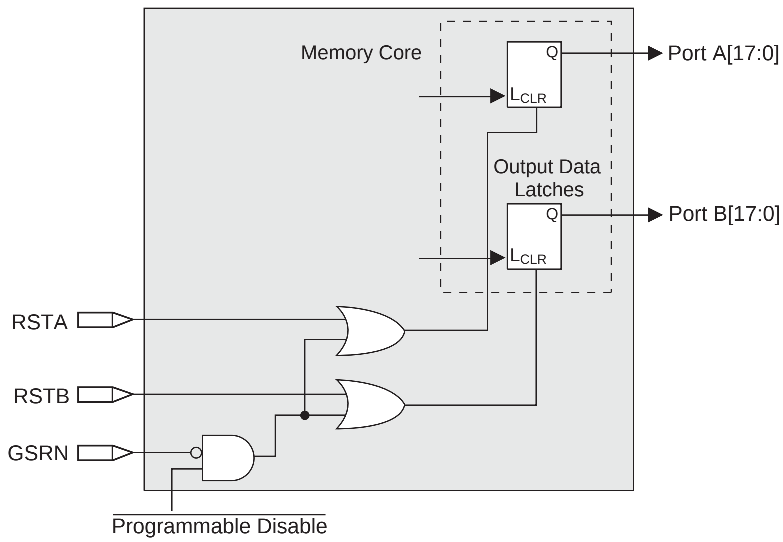
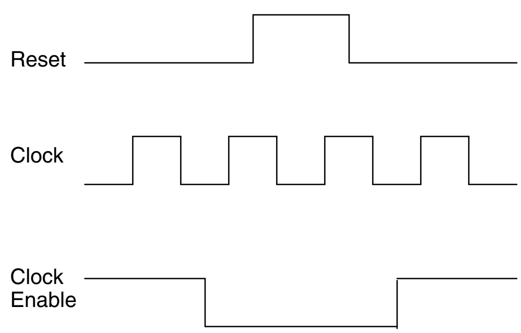


For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EBR is always asynchronous.

Figure 2-14. EBR Asynchronous Reset (Including GSR) Timing Diagram



If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled

Table 2-10. Supported Output Standards

Output Standard	Drive	V_{CCIO} (Typ.)
Single-ended Interfaces		
LVTTL	4mA, 8mA, 12mA, 16mA	3.3
LVCMOS33	4mA, 8mA, 12mA, 14mA	3.3
LVCMOS25	4mA, 8mA, 12mA, 14mA	2.5
LVCMOS18	4mA, 8mA, 12mA, 14mA	1.8
LVCMOS15	4mA, 8mA	1.5
LVCMOS12	2mA, 6mA	1.2
LVCMOS33, Open Drain	4mA, 8mA, 12mA, 14mA	—
LVCMOS25, Open Drain	4mA, 8mA, 12mA, 14mA	—
LVCMOS18, Open Drain	4mA, 8mA, 12mA, 14mA	—
LVCMOS15, Open Drain	4mA, 8mA	—
LVCMOS12, Open Drain	2mA, 6mA	—
PCI33[3]	N/A	3.3
Differential Interfaces		
LVDS[1, 2]	N/A	2.5
BLVDS, RSDS[2]	N/A	2.5
LVPECL[2]	N/A	3.3

1. MachXO1200 and MachXO2280 devices have dedicated LVDS buffers.
2. These interfaces can be emulated with external resistors in all devices.
3. Top Banks of MachXO1200 and MachXO2280 devices only.

sysIO Buffer Banks

The number of Banks vary between the devices of this family. Eight Banks surround the two larger devices, the MachXO1200 and MachXO2280 (two Banks per side). The MachXO640 has four Banks (one Bank per side). The smallest member of this family, the MachXO256, has only two Banks.

Each sysIO buffer Bank is capable of supporting multiple I/O standards. Each Bank has its own I/O supply voltage (V_{CCIO}) which allows it to be completely independent from the other Banks. Figure 2-18, Figure 2-18, Figure 2-20 and Figure 2-21 shows the sysIO Banks and their associated supplies for all devices.

Figure 2-18. MachXO2280 Banks

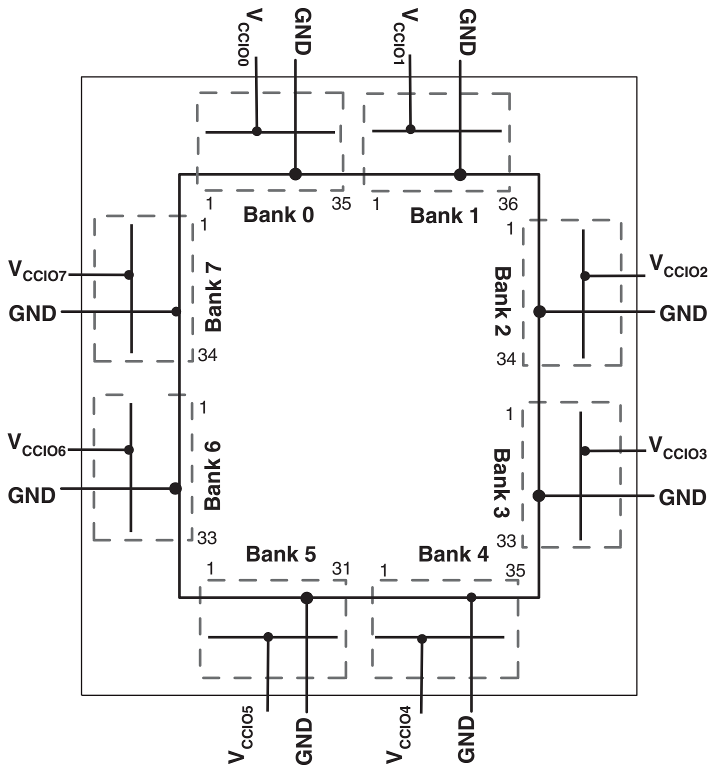


Figure 2-19. MachXO1200 Banks

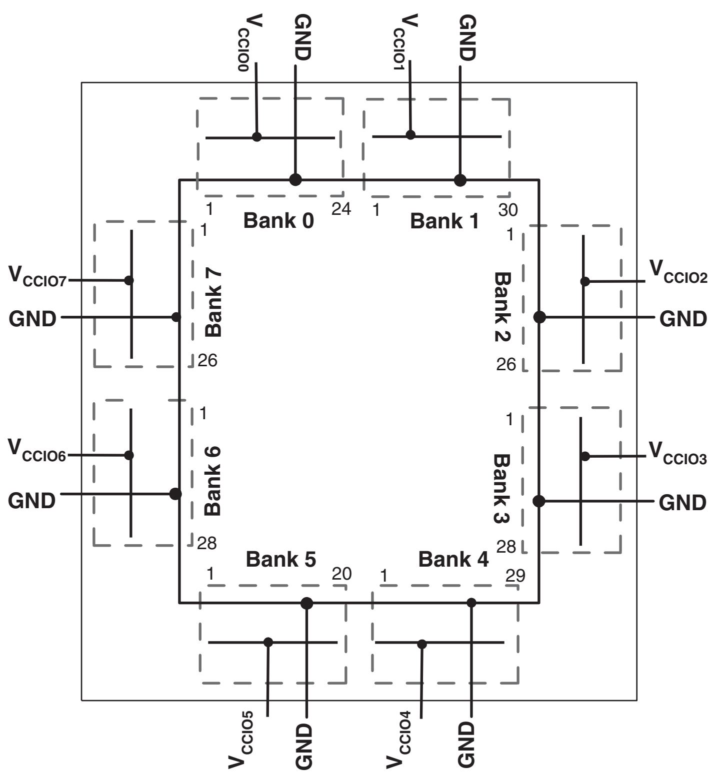


the system. These capabilities make the MachXO ideal for many multiple power supply and hot-swap applications.

Sleep Mode

The MachXO "C" devices (V_{CC} = 1.8/2.5/3.3V) have a sleep mode that allows standby current to be reduced dramatically during periods of system inactivity. Entry and exit to Sleep mode is controlled by the SLEEPN pin.

During Sleep mode, the logic is non-operational, registers and EBR contents are not maintained, and I/Os are tri-stated. Do not enter Sleep mode during device programming or configuration operation. In Sleep mode, power supplies are in their normal operating range, eliminating the need for external switching of power supplies. Table 2-11 compares the characteristics of Normal, Off and Sleep modes.

Table 2-11. Characteristics of Normal, Off and Sleep Modes

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static Icc	Typical <10mA	0	Typical <100uA
I/O Leakage	<10µA	<1mA	<10µA
Power Supplies VCC/VCCIO/VCCAUX	Normal Range	0	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the VCC supply for the device. This pin also has a weak pull-up, along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to VCC is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically, the device enters sleep mode several hundred nanoseconds after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet shows a detailed timing diagram.

Oscillator

Every MachXO device has an internal CMOS oscillator. The oscillator can be routed as an input clock to the clock tree or to general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit to enable/disable the oscillator. The oscillator frequency ranges from 18MHz to 26MHz.

Configuration and Testing

The following section describes the configuration and testing features of the MachXO family of devices.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with one of the VCCIO Banks (MachXO256: V_{CCIO1}; MachXO640: V_{CCIO2}; MachXO1200 and MachXO2280: V_{CCIO5}) and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

Table 3-1. LVDS DC Conditions

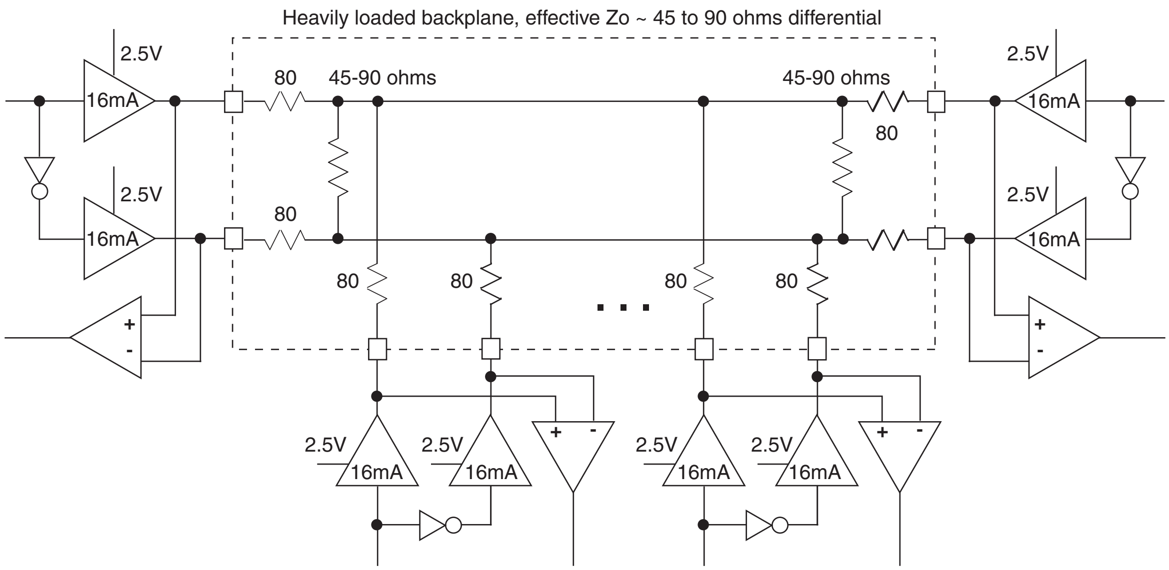
Over Recommended Operating Conditions

Parameter	Description	Typical	Units
Z_{OUT}	Output impedance	20	Ω
R_S	Driver series resistor	294	Ω
R_P	Driver parallel resistor	121	Ω
R_T	Receiver termination	100	Ω
V_{OH}	Output high voltage	1.43	V
V_{OL}	Output low voltage	1.07	V
V_{OD}	Output differential voltage	0.35	V
V_{CM}	Output common mode voltage	1.25	V
Z_{BACK}	Back impedance	100	Ω
I_{DC}	DC output current	3.66	mA

BLVDS

The MachXO family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. The input standard is supported by the LVDS differential input buffer on certain devices. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

Figure 3-2. BLVDS Multi-point Output Example



Typical Building Block Function Performance[1]

Pin-to-Pin Performance (LVCMOS25 12mA Drive)

Function	-5 Timing	Units
Basic Functions		
16-bit decoder	6.7	ns
4:1 MUX	4.5	ns
16:1 MUX	5.1	ns

Register-to-Register Performance

Function	-5 Timing	Units
Basic Functions		
16:1 MUX	487	MHz
16-bit adder	292	MHz
16-bit counter	388	MHz
64-bit counter	200	MHz
Embedded Memory Functions (1200 and 2280 Devices Only)		
256x36 Single Port RAM	284	MHz
512x18 True-Dual Port RAM	284	MHz
Distributed Memory Functions		
16x2 Single Port RAM	434	MHz
64x2 Single Port RAM	320	MHz
128x4 Single Port RAM	261	MHz
32x2 Pseudo-Dual Port RAM	314	MHz
64x4 Pseudo-Dual Port RAM	271	MHz

1. The above timing numbers are generated using the ispLEVER design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

Rev. A 0.19

Derating Logic Timing

Logic Timing provided in the following sections of the data sheet and the ispLEVER design tools are worst case numbers in the operating range. Actual delays may be much faster. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

sysCLOCK PLL Timing

Over Recommended Operating Conditions

Parameter	Descriptions	Conditions	Min.	Max.	Units
f_{IN}	Input Clock Frequency (CLKI, CLKFB)		25	420	MHz
		Input Divider (M) = 1; Feedback Divider (N) <= 4[5, 6]	18	25	MHz
f_{OUT}	Output Clock Frequency (CLKOP, CLKOS)		25	420	MHz
f_{OUT2}	K-Divider Output Frequency (CLKOK)		0.195	210	MHz
f_{VCO}	PLL VCO Frequency		420	840	MHz
f_{PFD}	Phase Detector Input Frequency		25	—	MHz
		Input Divider (M) = 1; Feedback Divider (N) <= 4[5, 6]	18	25	MHz
AC Characteristics					
t_{DT}	Output Clock Duty Cycle	Default duty cycle selected[3]	45	55	%
t_{PH}[4]	Output Phase Accuracy		—	0.05	UI
t_{OPJIT}[1]	Output Clock Period Jitter	f_{OUT} >= 100 MHz	—	+/-120	ps
		f_{OUT} < 100 MHz	—	0.02	UIPP
t_{SK}	Input Clock to Output Clock Skew	Divider ratio = integer	—	+/-200	ps
t_W	Output Clock Pulse Width	At 90% or 10%[3]	1	—	ns
t_{LOCK}[2]	PLL Lock-in Time		—	150	µs
t_{PA}	Programmable Delay Unit		100	450	ps
t_{IPJIT}	Input Clock Period Jitter	$f_{OUT} \geq$ 100 MHz	—	+/-200	ps
		f_{OUT} < 100 MHz	—	0.02	UI
t_{FBKDLY}	External Feedback Delay		—	10	ns
t_{HI}	Input Clock High Time	90% to 90%	0.5	—	ns
t_{LO}	Input Clock Low Time	10% to 10%	0.5	—	ns
t_{RST}	RST Pulse Width		10	—	ns

1. Jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock.
2. Output clock is valid after t_{LOCK} for PLL reset and dynamic delay adjustment.
3. Using LVDS output buffers.
4. CLKOS as compared to CLKOP output.
5. When using an input frequency less than 25 MHz the output frequency must be less than or equal to 4 times the input frequency.
6. The on-chip oscillator can be used to provide reference clock input to the PLL provided the output frequency restriction for clock inputs below 25 MHz are followed.
