
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	285
Number of Logic Elements/Cells	2280
Total RAM Bits	28262
Number of I/O	101
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	132-LFBGA, CSPBGA
Supplier Device Package	132-CSPBGA (8x8)

MachXO Family Data Sheet Introduction

June 2013 Data Sheet DS1002

Features

- **Non-volatile, Infinitely Reconfigurable**
  - Instant-on – powers up in microseconds
  - Single chip, no external configuration memory required
  - Excellent design security, no bit stream to intercept
  - Reconfigure SRAM based logic in milliseconds
  - SRAM and non-volatile memory programmable through JTAG port
  - Supports background programming of non-volatile memory
- **Sleep Mode**
  - Allows up to 100x static current reduction
- **TransFR™ Reconfiguration (TFR)**
  - In-field logic update while system operates
- **High I/O to Logic Density**
  - 256 to 2280 LUT4s
  - 73 to 271 I/Os with extensive package options
  - Density migration supported
  - Lead free/RoHS compliant packaging
- **Embedded and Distributed Memory**
  - Up to 27.6 Kbits sysMEM™ Embedded Block RAM
  - Up to 7.7 Kbits distributed RAM
  - Dedicated FIFO control logic
- **Flexible I/O Buffer**
  - Programmable sysIO™ buffer supports wide range of interfaces:
    - LVCMOS 3.3/2.5/1.8/1.5/1.2
    - LVTTL
    - PCI
    - LVDS, Bus-LVDS, LVPECL, RSDS
- **sysCLOCK™ PLLs**
  - Up to two analog PLLs per device
  - Clock multiply, divide, and phase shifting
- **System Level Support**
  - IEEE Standard 1149.1 Boundary Scan
  - Onboard oscillator
  - Devices operate with 3.3V, 2.5V, 1.8V or 1.2V power supply
  - IEEE 1532 compliant in-system programming

Introduction

The MachXO is optimized to meet the requirements of applications traditionally addressed by CPLDs and low capacity FPGAs: glue logic, bus bridging, bus interfacing, power-up control, and control logic. These devices bring together the best features of CPLD and FPGA devices on a single chip.

Table 1-1. MachXO Family Selection Guide

Device	LCMXO256	LCMXO640	LCMXO1200	LCMXO2280
LUTs	256	640	1200	2280
Dist. RAM (Kbits)	2.0	6.1	6.4	7.7
EBR SRAM (Kbits)	0	0	9.2	27.6
Number of EBR SRAM Blocks (9 Kbits)	0	0	1	3
V_{CC} Voltage	1.2/1.8/2.5/3.3V	1.2/1.8/2.5/3.3V	1.2/1.8/2.5/3.3V	1.2/1.8/2.5/3.3V
Number of PLLs	0	0	1	2
Max. I/O	78	159	211	271
Packages				
100-pin TQFP (14x14 mm)	78	74	73	73
144-pin TQFP (20x20 mm)		113	113	113
100-ball csBGA (8x8 mm)	78	74		
132-ball csBGA (8x8 mm)		101	101	101
256-ball caBGA (14x14 mm)		159	211	211
256-ball ftBGA (17x17 mm)		159	211	211
324-ball ftBGA (19x19 mm)				271

The devices use look-up tables (LUTs) and embedded block memories traditionally associated with FPGAs for flexible and efficient logic implementation. Through non-volatile technology, the devices provide the single-chip, high-security, instant-on capabilities traditionally associated with CPLDs. Finally, advanced process technology and careful design will provide the high pin-to-pin performance also associated with CPLDs.

The ispLEVER® design tools from Lattice allow complex designs to be efficiently implemented using the MachXO family of devices. Popular logic synthesis tools provide synthesis library support for MachXO. The ispLEVER tools use the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the MachXO device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

MachXO Family Data Sheet Architecture

June 2013 Data Sheet DS1002

Architecture Overview

The MachXO family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). Some devices in this family have sysCLOCK PLLs and blocks of sysMEM™ Embedded Block RAM (EBRs). Figures 2-1, 2-2, and 2-3 show the block diagrams of the various family members.

The logic blocks are arranged in a two-dimensional grid with rows and columns. The EBR blocks are arranged in a column to the left of the logic array. The PIO cells are located at the periphery of the device, arranged into Banks. The PIOs utilize a flexible I/O buffer referred to as a sysIO interface that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and the Programmable Functional unit without RAM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PFF block contains building blocks for logic, arithmetic, ROM, and register functions. Both the PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and effectively. Logic blocks are arranged in a two-dimensional array. Only one type of block is used per row.

In the MachXO family, the number of sysIO Banks varies by device. There are different types of I/O Buffers on different Banks. See the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks; these blocks are found only in the larger devices. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT use.

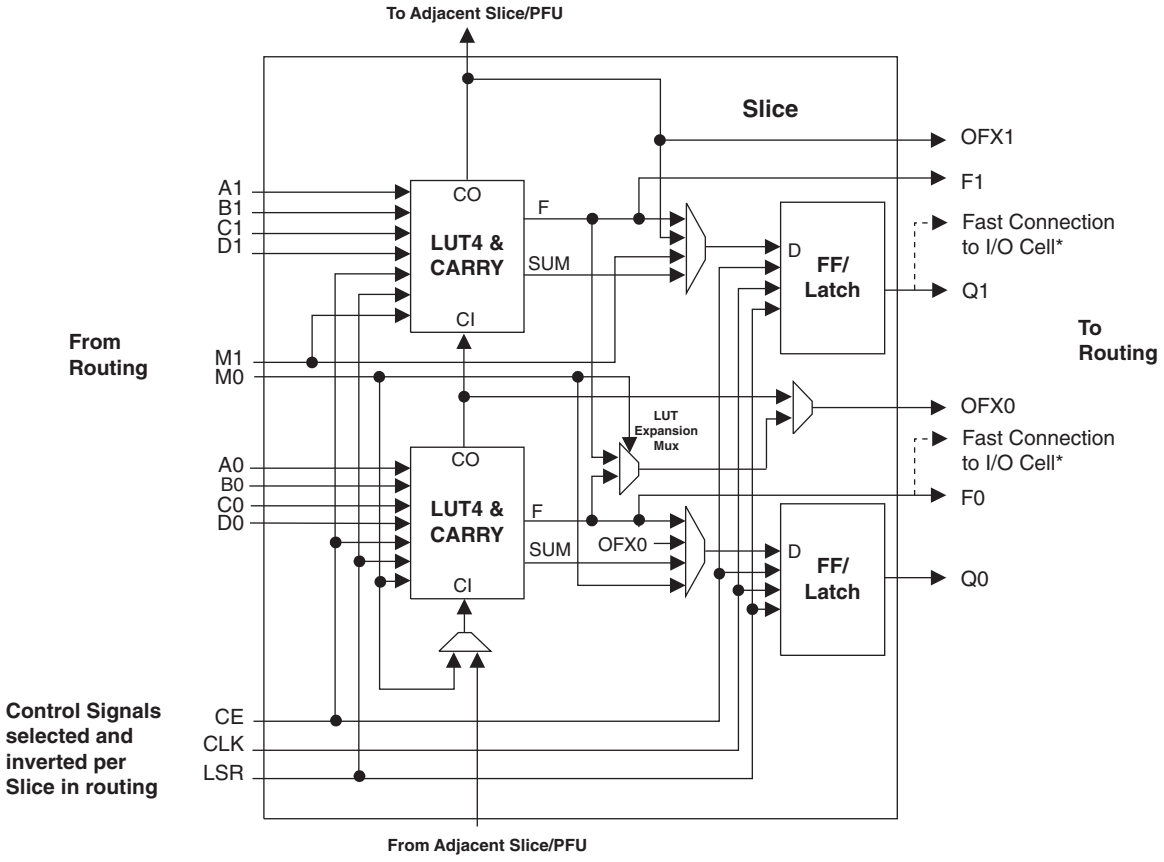
The MachXO registers in PFU and sysI/O can be configured to be SET or RESET. After power up and device is configured, the device enters into user mode with these registers SET/RESET according to the configuration setting, allowing device entering to a known state for predictable system function.

The MachXO architecture provides up to two sysCLOCK™ Phase Locked Loop (PLL) blocks on larger devices. These blocks are located at either end of the memory blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a JTAG Port that supports programming and configuration of the device as well as access to the user logic. The MachXO devices are available for operation from 3.3V, 2.5V, 1.8V, and 1.2V power supplies, providing easy integration into the overall system.

There are 14 input signals: 13 signals from routing and one from the carry-chain (from the adjacent Slice/PFU). There are 7 outputs: 6 to the routing and one to the carry-chain (to the adjacent Slice/PFU). Table 2-1 lists the signals associated with each Slice.

Figure 2-5. Slice Diagram



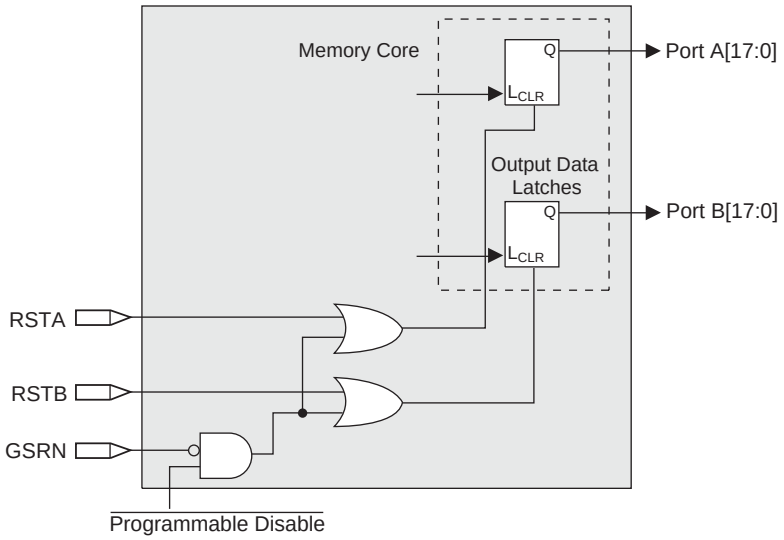
Notes:
Some inter-Slice signals are not shown.
*** Only PFUs at the edges have fast connections to the I/O cell.**

Table 2-1. Slice Signal Descriptions

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0/M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCIN	Fast Carry In[1]
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8[2] MUX depending on the Slice
Output	Inter-PFU signal	FCO	Fast Carry Out[1]

1. See Figure 2-4 for connection details.
2. Requires two PFUs.

Figure 2-13. Memory Core Reset

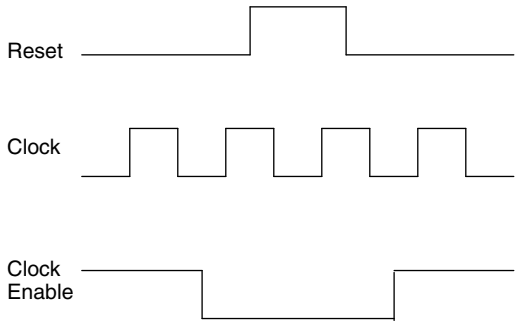


For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EBR is always asynchronous.

Figure 2-14. EBR Asynchronous Reset (Including GSR) Timing Diagram



If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled

of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after V_{CC}, V_{CCAUX}, and V_{CCIO} are at valid operating levels and the device has been configured.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

2. **Left and Right sysIO Buffer Pairs**
The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user’s responsibility to ensure that all V_{CCIO} Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to VCCIO. The I/O pins will maintain the blank configuration until VCC, VCCAUX and VCCIO have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore, V_{CCIO} supplies should be powered up before or together with the V_{CC} and V_{CCAUX} supplies

Supported Standards

The MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTL. The buffer supports the LVTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The MachXO1200 and MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of MachXO1200 and MachXO2280 devices. PCI support is provided in the top Banks of the MachXO1200 and MachXO2280 devices. Table 2-8 summarizes the I/O characteristics of the devices in the MachXO family.

Tables 2-9 and 2-10 show the I/O standards (together with their supply and reference voltages) supported by the MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

Device Configuration

All MachXO devices contain a test access port that can be used for device configuration and programming.

The non-volatile memory in the MachXO can be configured in two different modes:

- In IEEE 1532 mode via the IEEE 1149.1 port. In this mode, the device is off-line and I/Os are controlled by BSCAN registers.
- In background mode via the IEEE 1149.1 port. This allows the device to remain operational in user mode while reprogramming takes place.

The SRAM configuration memory can be configured in three different ways:

- At power-up via the on-chip non-volatile memory.
- After a refresh command is issued via the IEEE 1149.1 port.
- In IEEE 1532 mode via the IEEE 1149.1 port.

Figure 2-22 provides a pictorial representation of the different programming modes available in the MachXO devices. On power-up, the SRAM is ready to be configured with IEEE 1149.1 serial TAP port using IEEE 1532 protocols.

Leave Alone I/O
When using IEEE 1532 mode for non-volatile memory programming, SRAM configuration, or issuing a refresh command, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reconfiguration or reprogramming occurs on-the-fly.

TransFR (Transparent Field Reconfiguration)
TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See TN1087, Minimizing System Interruption During Configuration Using TransFR Technology for details.

Security
The MachXO devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear the security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

sysIO Recommended Operating Conditions

Standard	V_{CCIO} (V)		
	Min.	Typ.	Max.
LVCMOS 3.3	3.135	3.3	3.465
LVCMOS 2.5	2.375	2.5	2.625
LVCMOS 1.8	1.71	1.8	1.89
LVCMOS 1.5	1.425	1.5	1.575
LVCMOS 1.2	1.14	1.2	1.26
LVTTL	3.135	3.3	3.465
PCI[3]	3.135	3.3	3.465
LVDS[1, 2]	2.375	2.5	2.625

1. The average DC current drawn by I/Os between GND connections, or between the last GND in an I/O Bank and the end of an I/O Bank, as shown in the logic signal connections table shall not exceed n * 8mA. Where n is the number of I/Os between Bank GND connections or between the last GND in a Bank and the end of a Bank.

Typical Building Block Function Performance[1]

Pin-to-Pin Performance (LVCMOS25 12mA Drive)

Function	-5 Timing	Units
Basic Functions		
16-bit decoder	6.7	ns
4:1 MUX	4.5	ns
16:1 MUX	5.1	ns

Register-to-Register Performance

Function	-5 Timing	Units
Basic Functions		
16:1 MUX	487	MHz
16-bit adder	292	MHz
16-bit counter	388	MHz
64-bit counter	200	MHz
Embedded Memory Functions (1200 and 2280 Devices Only)		
256x36 Single Port RAM	284	MHz
512x18 True-Dual Port RAM	284	MHz
Distributed Memory Functions		
16x2 Single Port RAM	434	MHz
64x2 Single Port RAM	320	MHz
128x4 Single Port RAM	261	MHz
32x2 Pseudo-Dual Port RAM	314	MHz
64x4 Pseudo-Dual Port RAM	271	MHz

1. The above timing numbers are generated using the ispLEVER design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.
