Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	32
Number of Logic Elements/Cells	256
Total RAM Bits	-
Number of I/O	78
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-LQFP
Supplier Device Package	100-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo256e-3t100i

The devices use look-up tables (LUTs) and embedded block memories traditionally associated with FPGAs for flexible and efficient logic implementation. Through non-volatile technology, the devices provide the single-chip, high-security, instant-on capabilities traditionally associated with CPLDs. Finally, advanced process technology and careful design will provide the high pin-to-pin performance also associated with CPLDs.

The ispLEVER® design tools from Lattice allow complex designs to be efficiently implemented using the MachXO family of devices. Popular logic synthesis tools provide synthesis library support for MachXO. The ispLEVER tools use the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the MachXO device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

The ispLEVER design tool takes the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

Clock/Control Distribution Network

The MachXO family of devices provides global signals that are available to all PFUs. These signals consist of four primary clocks and four secondary clocks. Primary clock signals are generated from four 16:1 muxes as shown in Figure 2-7 and Figure 2-8. The available clock sources for the MachXO256 and MachXO640 devices are four dual function clock pins and 12 internal routing signals. The available clock sources for the MachXO1200 and MachXO2280 devices are four dual function clock pins, up to nine internal routing signals and up to six PLL outputs.

Figure 2-7. Primary Clocks for MachXO256 and MachXO640 Devices

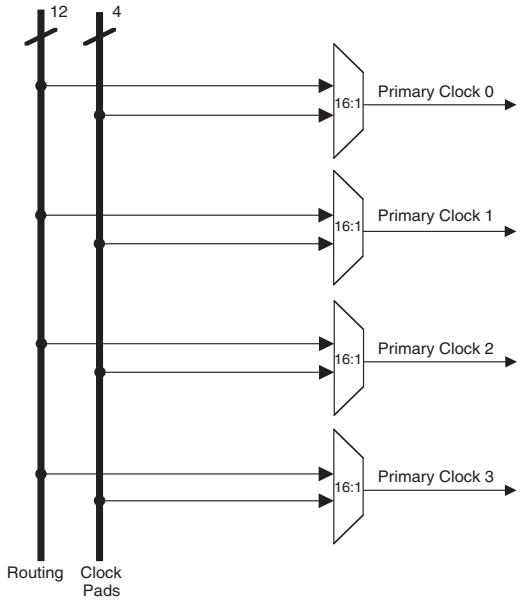

Figure 2-8. Primary Clocks for MachXO1200 and MachXO2280 Devices

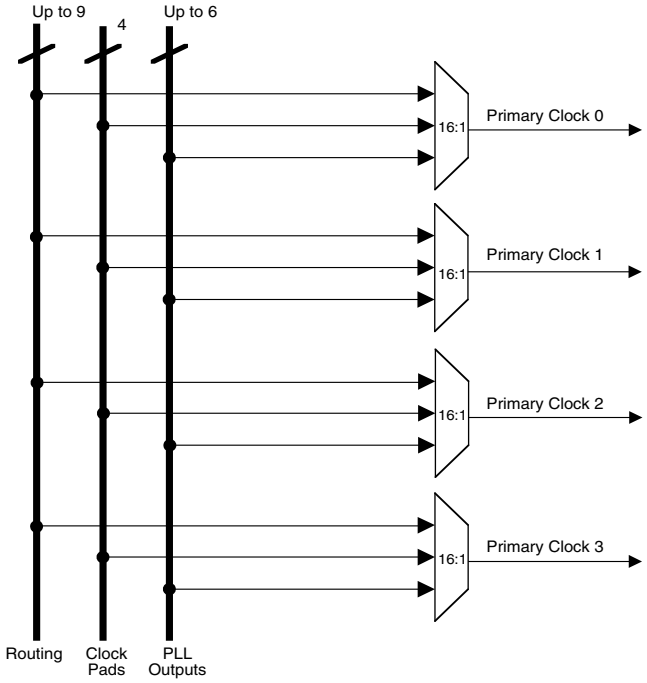
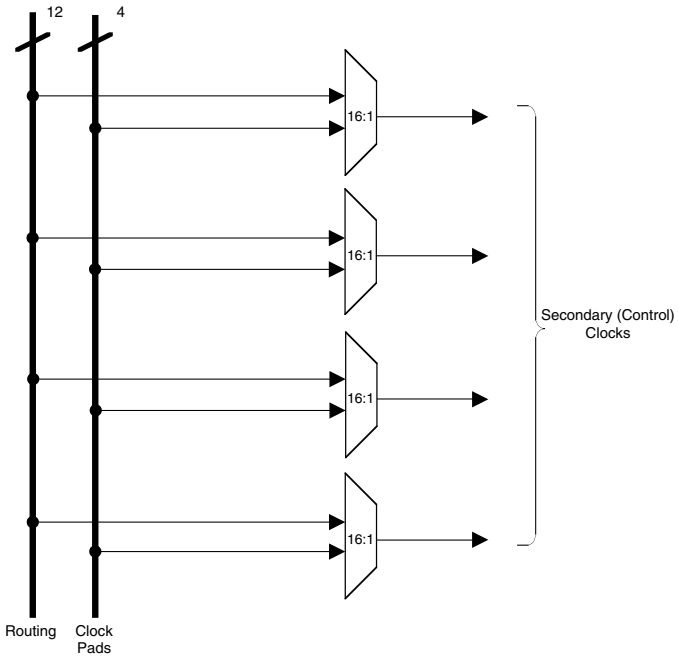


Four secondary clocks are generated from four 16:1 muxes as shown in Figure 2-9. Four of the secondary clock sources come from dual function clock pins and 12 come from internal routing.

Figure 2-9. Secondary Clocks for MachXO Devices



sysCLOCK Phase Locked Loops (PLLs)

The MachXO1200 and MachXO2280 provide PLL support. The source of the PLL input divider can come from an external pin or from internal routing. There are four sources of feedback signals to the feedback divider: from CLKINTFB (internal feedback port), from the global clock nets, from the output of the post scalar divider, and from the routing (or from an external pin). There is a PLL_LOCK signal to indicate that the PLL has locked on to the input clock signal. Figure 2-10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the t_{LOCK} parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider, and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

Figure 2-10. PLL Diagram

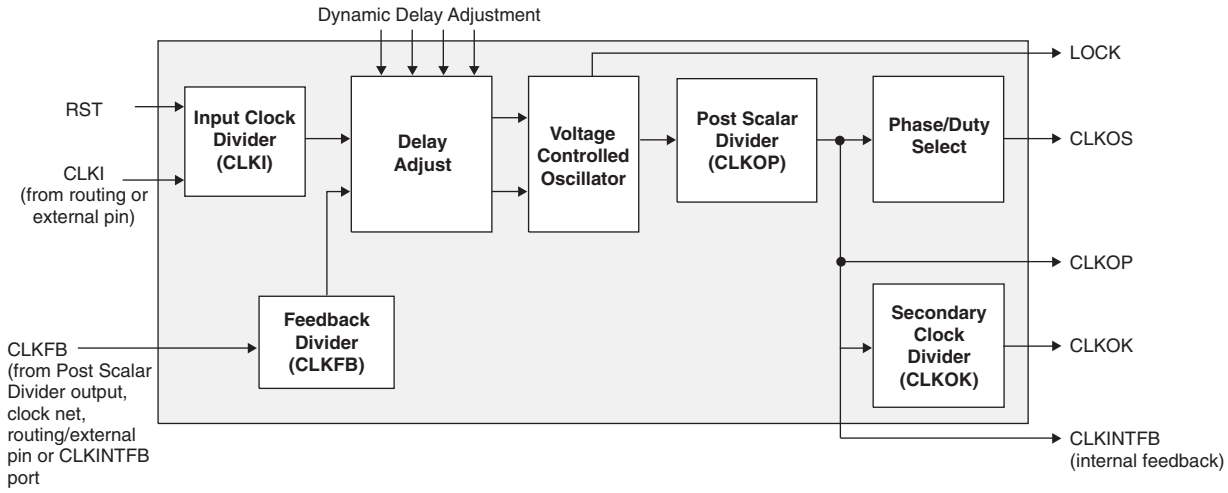


Figure 2-11 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

Figure 2-11. PLL Primitive

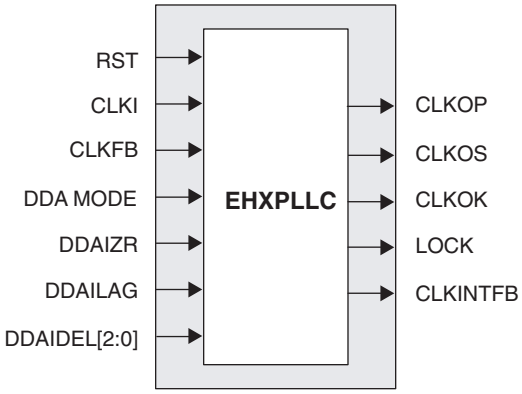

Table 2-5. PLL Signal Descriptions

Signal	I/O	Description
CLKI	I	Clock input from external pin or routing
CLKFB	I	PLL feedback input from PLL output, clock net, routing/external pin or internal feedback from CLKINTFB port
RST	I	"1" to reset the input clock divider
CLKOS	O	PLL output clock to clock tree (phase shifted/duty cycle changed)
CLKOP	O	PLL output clock to clock tree (No phase shift)
CLKOK	O	PLL output to clock tree through secondary clock divider
LOCK	O	"1" indicates PLL LOCK to CLKI
CLKINTFB	O	Internal feedback source, CLKOP divider output before CLOCKTREE
DDAMODE	I	Dynamic Delay Enable. "1": Pin control (dynamic), "0": Fuse Control (static)
DDAIZR	I	Dynamic Delay Zero. "1": delay = 0, "0": delay = on
DDAILAG	I	Dynamic Delay Lag/Lead. "1": Lag, "0": Lead
DDAIDEL[2:0]	I	Dynamic Delay Input

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

sysMEM Memory

The MachXO1200 and MachXO2280 devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

Table 2-6. sysMEM Block Configurations

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36

the system. These capabilities make the MachXO ideal for many multiple power supply and hot-swap applications.

Sleep Mode

The MachXO "C" devices (V_{CC} = 1.8/2.5/3.3V) have a sleep mode that allows standby current to be reduced dramatically during periods of system inactivity. Entry and exit to Sleep mode is controlled by the SLEEPN pin.

During Sleep mode, the logic is non-operational, registers and EBR contents are not maintained, and I/Os are tri-stated. Do not enter Sleep mode during device programming or configuration operation. In Sleep mode, power supplies are in their normal operating range, eliminating the need for external switching of power supplies. Table 2-11 compares the characteristics of Normal, Off and Sleep modes.

Table 2-11. Characteristics of Normal, Off and Sleep Modes

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static Icc	Typical <10mA	0	Typical <100uA
I/O Leakage	<10µA	<1mA	<10µA
Power Supplies VCC/VCCIO/VCCAUX	Normal Range	0	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the VCC supply for the device. This pin also has a weak pull-up, along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to VCC is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically, the device enters sleep mode several hundred nanoseconds after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet shows a detailed timing diagram.

Oscillator

Every MachXO device has an internal CMOS oscillator. The oscillator can be routed as an input clock to the clock tree or to general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit to enable/disable the oscillator. The oscillator frequency ranges from 18MHz to 26MHz.

Configuration and Testing

The following section describes the configuration and testing features of the MachXO family of devices.

IEEE 1149.1-Compliant Boundary Scan Testability

All MachXO devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with one of the VCCIO Banks (MachXO256: V_{CCIO1}; MachXO640: V_{CCIO2}; MachXO1200 and MachXO2280: V_{CCIO5}) and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

MachXO256 and MachXO640 Hot Socketing Specifications[1, 2, 3]

Symbol	Parameter	Condition	Min.	Typ.	Max	Units
I_{DK}	Input or I/O leakage Current	$0 \le V_{IN} \le V_{IH}$ (MAX)	—	—	+/-1000	µA

1. Insensitive to sequence of V_{CC}, V_{CCAUX}, and V_{CCIO}. However, assumes monotonic rise/fall rates for V_{CC}, V_{CCAUX}, and V_{CCIO}.
2. $0 \le V_{CC} \le V_{CC}$ (MAX), $0 \le V_{CCIO} \le V_{CCIO}$ (MAX) and $0 \le V_{CCAUX} \le V_{CCAUX}$ (MAX).
3. I_{DK} is additive to I_{PU}, I_{PD} or I_{BH}.

MachXO1200 and MachXO2280 Hot Socketing Specifications[1, 2, 3]

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
Non-LVDS General Purpose sysIOs						
I_{DK}	Input or I/O Leakage Current	$0 \le V_{IN} \le V_{IH}$ (MAX.)	—	—	+/-1000	µA
LVDS General Purpose sysIOs						
I_{DK_LVDS}	Input or I/O Leakage Current	$V_{IN} \le V_{CCIO}$	—	—	+/-1000	µA
		$V_{IN} > V_{CCIO}$	—	35	—	mA

1. Insensitive to sequence of V_{CC}, V_{CCAUX}, and V_{CCIO}. However, assumes monotonic rise/fall rates for V_{CC}, V_{CCAUX}, and V_{CCIO}.
2. $0 \le V_{CC} \le V_{CC}$ (MAX), $0 \le V_{CCIO} \le V_{CCIO}$ (MAX), and $0 \le V_{CCAUX} \le V_{CCAUX}$ (MAX).
3. I_{DK} is additive to I_{PU}, I_{PW} or I_{BH}.

DC Electrical Characteristics

Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I_{IL}, I_{IH}[1, 4, 5]	Input or I/O Leakage	$0 \le V_{IN} \le (V_{CCIO} - 0.2V)$	—	—	10	µA
		$(V_{CCIO} - 0.2V) < V_{IN} \le 3.6V$	—	—	40	µA
I_{PU}	I/O Active Pull-up Current	$0 \le V_{IN} \le 0.7\ V_{CCIO}$	-30	—	-150	µA
I_{PD}	I/O Active Pull-down Current	V_{IL} (MAX) $\le V_{IN} \le V_{IH}$ (MAX)	30	—	150	µA
I_{BHLS}	Bus Hold Low sustaining current	$V_{IN} = V_{IL}$ (MAX)	30	—	—	µA
I_{BHHS}	Bus Hold High sustaining current	$V_{IN} = 0.7V_{CCIO}$	-30	—	—	µA
I_{BHLO}	Bus Hold Low Overdrive current	$0 \le V_{IN} \le V_{IH}$ (MAX)	—	—	150	µA
I_{BHHO}	Bus Hold High Overdrive current	$0 \le V_{IN} \le V_{IH}$ (MAX)	—	—	-150	µA
V_{BHT}[3]	Bus Hold trip Points	$0 \le V_{IN} \le V_{IH}$ (MAX)	V_{IL} (MAX)	—	V_{IH} (MIN)	V
C1	I/O Capacitance[2]	V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = Typ., V_{IO} = 0 to V_{IH} (MAX)	—	8	—	pf
C2	Dedicated Input Capacitance[2]	V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = Typ., V_{IO} = 0 to V_{IH} (MAX)	—	8	—	pf

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2. T_A 25°C, f = 1.0MHz
3. Please refer to V_{IL} and V_{IH} in the sysIO Single-Ended DC Electrical Characteristics table of this document.
4. Not applicable to SLEEPN pin.
5. When V_{IH} is higher than V_{CCIO}, a transient current typically of 30ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For MachXO1200 and MachXO2280 true LVDS output pins, V_{IH} must be less than or equal to V_{CCIO}.

MachXO "C" Sleep Mode Timing

Symbol	Parameter	Device	Min.	Typ.	Max	Units
t_{PWRDN}	SLEEPN Low to Power Down	All	—	—	400	ns
t_{PWRUP}	SLEEPN High to Power Up	LCMXO256	—	—	400	µs
		LCMXO640	—	—	600	µs
		LCMXO1200	—	—	800	µs
		LCMXO2280	—	—	1000	µs
$t_{WSLEEPN}$	SLEEPN Pulse Width	All	400	—	—	ns
t_{WAWAKE}	SLEEPN Pulse Rejection	All	—	—	100	ns

Switching Test Conditions

Figure 3-6 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Figure 3-5.

Figure 3-6. Output Test Load, LVTTL and LVCMOS Standards

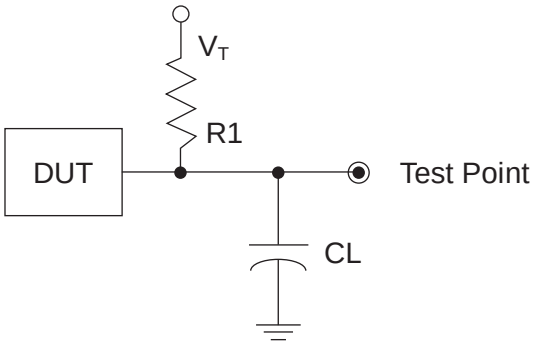

Table 3-5. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	R_1	C_L	Timing Ref.	V_T
LVTTL and LVCMOS settings (L -> H, H -> L)	∞	0pF	LVTTL, LVCMOS 3.3 = 1.5V	—
			LVCMOS 2.5 = $V_{CCIO}/2$	—
			LVCMOS 1.8 = $V_{CCIO}/2$	—
			LVCMOS 1.5 = $V_{CCIO}/2$	—
			LVCMOS 1.2 = $V_{CCIO}/2$	—
LVTTL and LVCMOS 3.3 (Z -> H)	188	0pF	1.5	V_{OL}
LVTTL and LVCMOS 3.3 (Z -> L)				V_{OH}
Other LVCMOS (Z -> H)			$V_{CCIO}/2$	V_{OL}
Other LVCMOS (Z -> L)			$V_{CCIO}/2$	V_{OH}
LVTTL + LVCMOS (H -> Z)			V_{OH} - 0.15	V_{OL}
LVTTL + LVCMOS (L -> Z)			V_{OL} - 0.15	V_{OH}

Note: Output test conditions for all other interfaces are determined by the respective standards.

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D/E/F]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top). [Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number. [A/B/C/D/E/F] indicates the PIO within the group to which the pad is connected. Some of these user programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic. During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-up resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-up resistor enabled.
GSRN	I	Global RESET signal (active low). Dedicated pad, when not in use it can be used as an I/O pin.
TSALL	I	TSALL is a dedicated pad for the global output enable signal. When TSALL is high all the outputs are tristated. It is a dual function pin. When not in use, it can be used as an I/O pin.
NC	—	No connect.
GND	—	GND - Ground. Dedicated pins.
V_{CC}	—	VCC - The power supply pins for core logic. Dedicated pins.
V_{CCAUX}	—	VCCAUX - the Auxiliary power supply pin. This pin powers up a variety of internal circuits including all the differential and referenced input buffers. Dedicated pins.
V_{CCIOx}	—	V_{CCIO} - The power supply pins for I/O Bank x. Dedicated pins.
SLEEPN[1]	I	Sleep Mode pin - Active low sleep pin.þ When this pin is held high, the device operates normally.þ This pin has a weak internal pull-up, but when unused, an external pull-up to V_{CC} is recommended. When driven low, the device moves into Sleep mode after a specified time.
PLL and Clock Functions (Used as user programmable I/O pins when not used for PLL or clock pins)		
[LOC][0]_PLL[T, C]_IN	—	Reference clock (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
[LOC][0]_PLL[T, C]_FB	—	Optional feedback (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
PCLK [n]_[1:0]	—	Primary Clock Pads, n per side.
Test and Programming (Dedicated pins)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin -Test Data output pin used to shift data out of the device using 1149.1.

1. Applies to MachXO “C” devices only. NC for “E” devices.

*Supports true LVDS outputs.
**Double bonded to the pin.
***NC for "E" devices.
****Primary clock inputs are single-ended.

Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the Thermal Management document to find the device/package specific thermal values.

For Further Information

For further information regarding Thermal Management, refer to the following:

- Thermal Management document
- TN1090 - Power Estimation and Management for MachXO Devices
- Power Calculator tool included with the Lattice ispLEVER design tool, or as a standalone download from www.latticesemi.com/software

Date	Version	Section	Change Summary
November 2006	02.3	DC and Switching Characteristics	Corrections to MachXO "C" Sleep Mode Timing table - value for $t_{WSLEEPN}$ (400ns) changed from max. to min. Value for t_{WAWAKE} (100ns) changed from min. to max.
			Added Flash Download Time table.
December 2006	02.4	Architecture	EBR Asynchronous Reset section added.
		Pinout Information	Power Supply and NC table: Pin/Ball orientation footnotes added.
February 2007	02.5	Architecture	Updated EBR Asynchronous Reset section.
August 2007	02.6	DC and Switching Characteristics	Updated sysIO Single-Ended DC Electrical Characteristics table.
November 2007	02.7	DC and Switching Characteristics	Added JTAG Port Timing Waveforms diagram.
		Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
June 2009	02.8	Introduction	Added 0.8-mm 256-pin caBGA package to MachXO Family Selection Guide table.
