## Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

The devices use look-up tables (LUTs) and embedded block memories traditionally associated with FPGAs for flexible and efficient logic implementation. Through non-volatile technology, the devices provide the single-chip, high-security, instant-on capabilities traditionally associated with CPLDs. Finally, advanced process technology and careful design will provide the high pin-to-pin performance also associated with CPLDs.

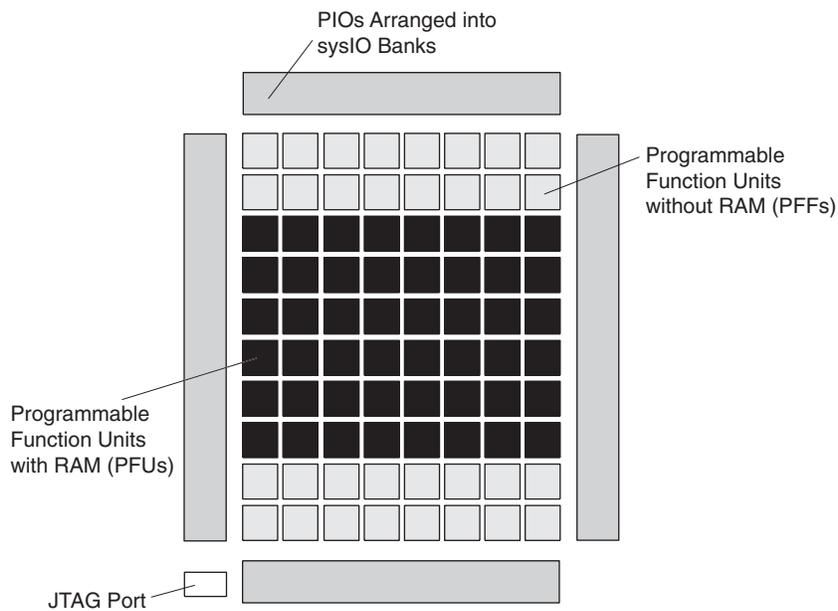

The ispLEVER<sup>®</sup> design tools from Lattice allow complex designs to be efficiently implemented using the MachXO family of devices. Popular logic synthesis tools provide synthesis library support for MachXO. The ispLEVER tools use the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the MachXO device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

**Figure 2-13. Memory Core Reset**

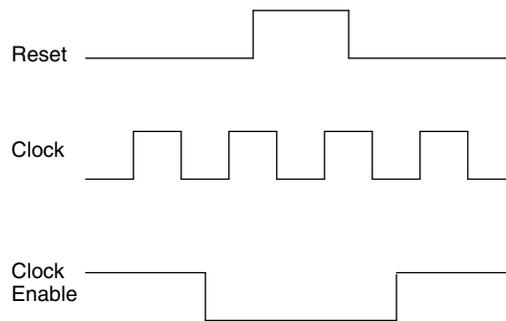

For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

**EBR Asynchronous Reset**

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EBR is always asynchronous.

**Figure 2-14. EBR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPRreset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPRreset are always asynchronous EBR inputs.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled

1. MachXO1200 and MachXO2280 devices have dedicated LVDS buffers.

2. These interfaces can be emulated with external resistors in all devices.

3. Top Banks of MachXO1200 and MachXO2280 devices only.

## sysIO Buffer Banks

The number of Banks vary between the devices of this family. Eight Banks surround the two larger devices, the MachXO1200 and MachXO2280 (two Banks per side). The MachXO640 has four Banks (one Bank per side). The smallest member of this family, the MachXO256, has only two Banks.

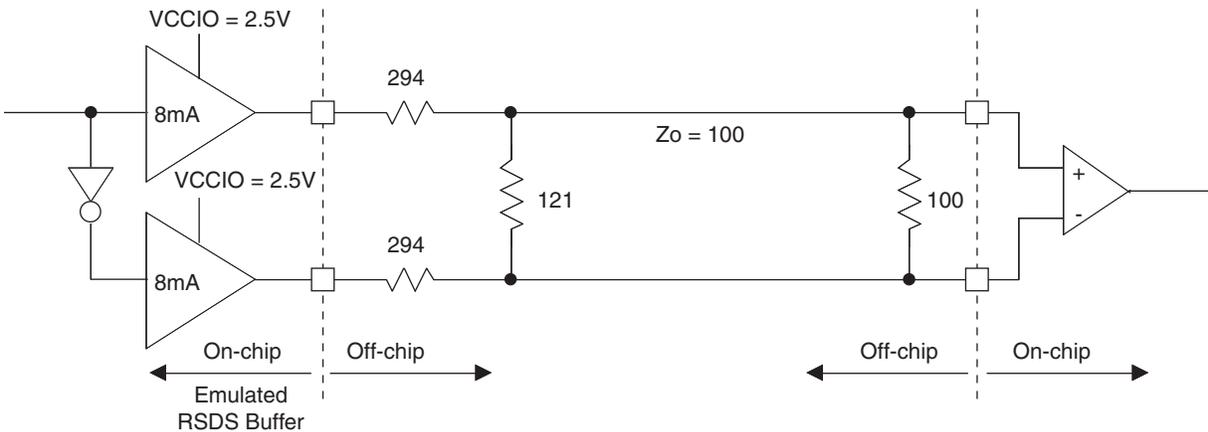

Each sysIO buffer Bank is capable of supporting multiple I/O standards. Each Bank has its own I/O supply voltage (V<sub>CCIO</sub>) which allows it to be completely independent from the other Banks. Figure 2-18, Figure 2-18, Figure 2-20 and Figure 2-21 shows the sysIO Banks and their associated supplies for all devices.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

## RSDS

The MachXO family supports the differential RSDS standard. The output standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

1. Jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock.

2. Output clock is valid after t<sub>LOCK</sub> for PLL reset and dynamic delay adjustment.

3. Using LVDS output buffers.

4. CLKOS as compared to CLKOP output.

5. When using an input frequency less than 25 MHz the output frequency must be less than or equal to 4 times the input frequency.

6. The on-chip oscillator can be used to provide reference clock input to the PLL provided the output frequency restriction for clock inputs below 25 MHz are followed.

### Revision History

Date	Version	Section	Change Summary
February 2005	01.0	—	Initial release.
October 2005	01.1	Introduction	Distributed RAM information in family table updated. Added footnote 1 - fpBGA packaging to the family selection guide.
		Architecture	sysIO Buffer section updated.
			Hot Socketing section updated.
			Sleep Mode section updated.
			SLEEP Pin Characteristics section updated.
			Oscillator section updated.
			Security section updated.
		DC and Switching Characteristics	Recommended Operating Conditions table updated.
			DC Electrical Characteristics table updated.
			Supply Current (Sleep Mode) table added with LCMXO256/640 data.
			Supply Current (Standby) table updated with LCMXO256/640 data.
			Initialization Supply Current table updated with LCMXO256/640 data.
			Programming and Erase Flash Supply Current table updated with LCMXO256/640 data.
			Register-to-Register Performance table updated (rev. A 0.16).
			External Switching Characteristics table updated (rev. A 0.16).
			Internal Timing Parameter table updated (rev. A 0.16).
			Family Timing Adders updated (rev. A 0.16).
			sysCLOCK Timing updated (rev. A 0.16).
			MachXO "C" Sleep Mode Timing updated (A 0.16).
			JTAG Port Timing Specification updated (rev. A 0.16).
		Pinout Information	SLEEPIN description updated.
			Pin Information Summary updated.
			Power Supply and NC Connection table has been updated.
Logic Signal Connection section has been updated to include all devices/packages.			
Ordering Information	Part Number Description section has been updated.		
	Ordering Part Number section has been updated (added LCMXO256C/LCMXO640C "4W").		
Supplemental Information	MachXO Density Migration Technical Note (TN1097) added.		
November 2005	01.2	Pinout Information	Added "Power Supply and NC Connections" summary information for LCMXO1200 and LCMXO2280 in 100 TQFP package.
December 2005	01.3	DC and Switching Characteristics	Supply Current (Standby) table updated with LCMXO1200/2280 data.
		Ordering Information	Ordering Part Number section updated (added LCMXO2280C "4W").
April 2006	02.0	Introduction	Introduction paragraphs updated.
		Architecture	Architecture Overview paragraphs updated.
