Lattice Semiconductor Corporation - LCMXO640C-4BN256C Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	80
Number of Logic Elements/Cells	640
Total RAM Bits	-
Number of I/O	159
Number of Gates	-
Voltage - Supply	1.71V ~ 3.465V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LFBGA, CSPBGA
Supplier Device Package	256-CABGA (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo640c-4bn256c

The devices use look-up tables (LUTs) and embedded block memories traditionally associated with FPGAs for flexible and efficient logic implementation. Through non-volatile technology, the devices provide the single-chip, high-security, instant-on capabilities traditionally associated with CPLDs. Finally, advanced process technology and careful design will provide the high pin-to-pin performance also associated with CPLDs.

The ispLEVER® design tools from Lattice allow complex designs to be efficiently implemented using the MachXO family of devices. Popular logic synthesis tools provide synthesis library support for MachXO. The ispLEVER tools use the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the MachXO device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

sysCLOCK Phase Locked Loops (PLLs)

The MachXO1200 and MachXO2280 provide PLL support. The source of the PLL input divider can come from an external pin or from internal routing. There are four sources of feedback signals to the feedback divider: from CLKINTFB (internal feedback port), from the global clock nets, from the output of the post scalar divider, and from the routing (or from an external pin). There is a PLL_LOCK signal to indicate that the PLL has locked on to the input clock signal. Figure 2-10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the t_{LOCK} parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider, and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

Figure 2-10. PLL Diagram

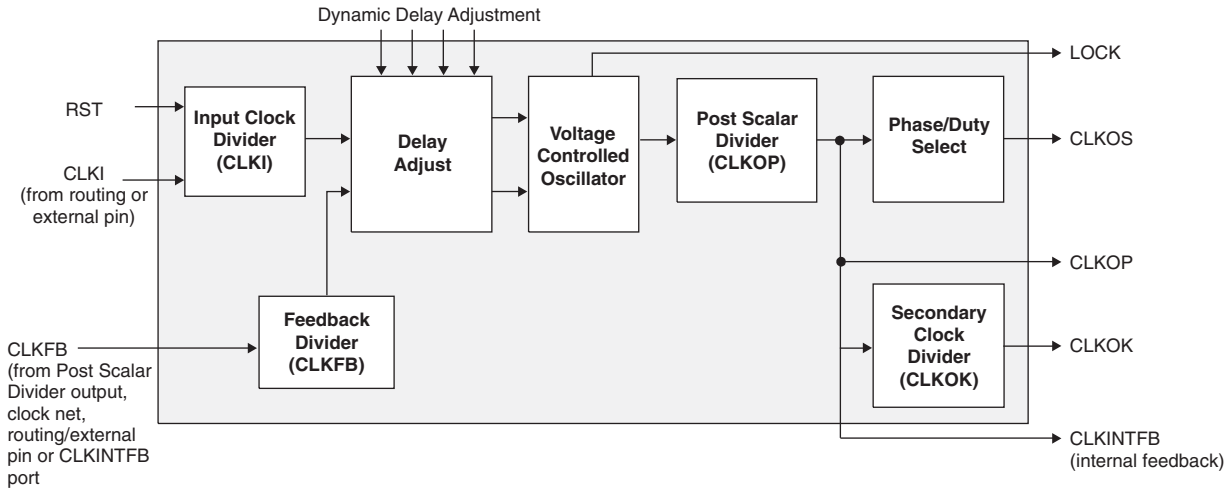

Figure 2-11 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

Figure 2-11. PLL Primitive

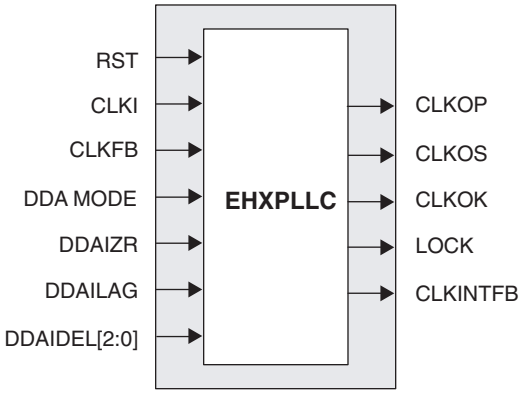

Figure 2-13. Memory Core Reset

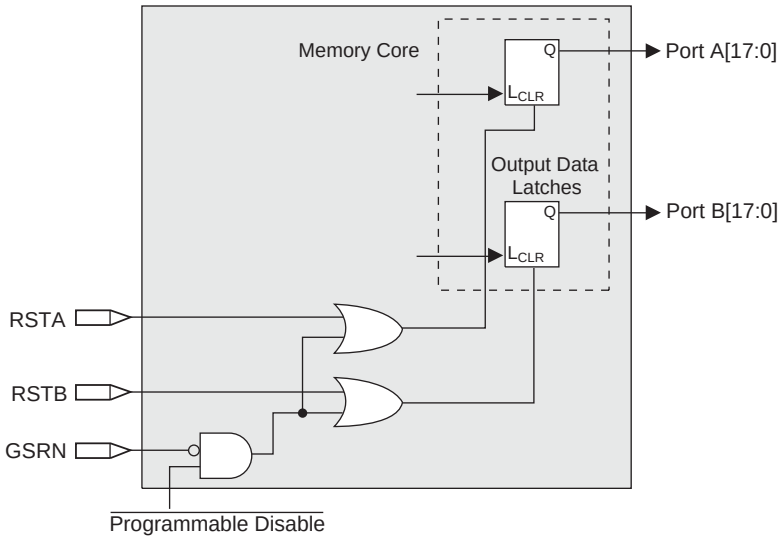
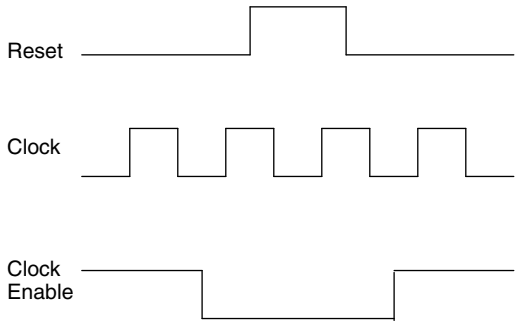


For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EBR is always asynchronous.

Figure 2-14. EBR Asynchronous Reset (Including GSR) Timing Diagram



If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of $1/f_{MAX}$ (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EBR inputs.

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled

PIO Groups

On the MachXO devices, PIO cells are assembled into two different types of PIO groups, those with four PIO cells and those with six PIO cells. PIO groups with four IOs are placed on the left and right sides of the device while PIO groups with six IOs are placed on the top and bottom. The individual PIO cells are connected to their respective sysIO buffers and PADs.

On all MachXO devices, two adjacent PIOs can be joined to provide a complementary Output driver pair. The I/O pin pairs are labeled as "T" and "C" to distinguish between the true and complement pins.

The MachXO1200 and MachXO2280 devices contain enhanced I/O capability. All PIO pairs on these larger devices can implement differential receivers. In addition, half of the PIO pairs on the left and right sides of these devices can be configured as LVDS transmit/receive pairs. PIOs on the top of these larger devices also provide PCI support.

Figure 2-15. Group of Four Programmable I/O Cells

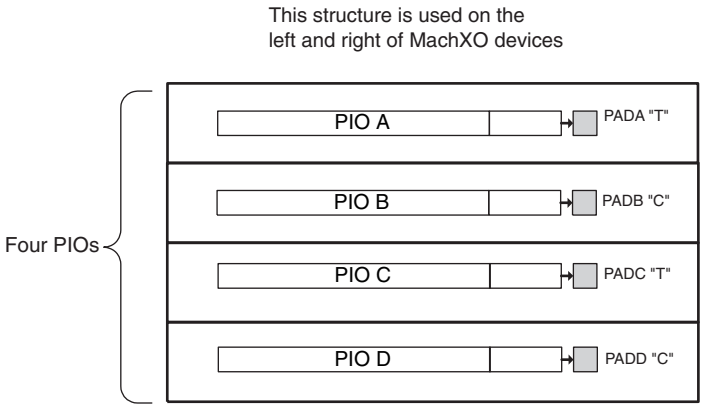


Figure 2-16. Group ofpSix Programmable I/O Cells

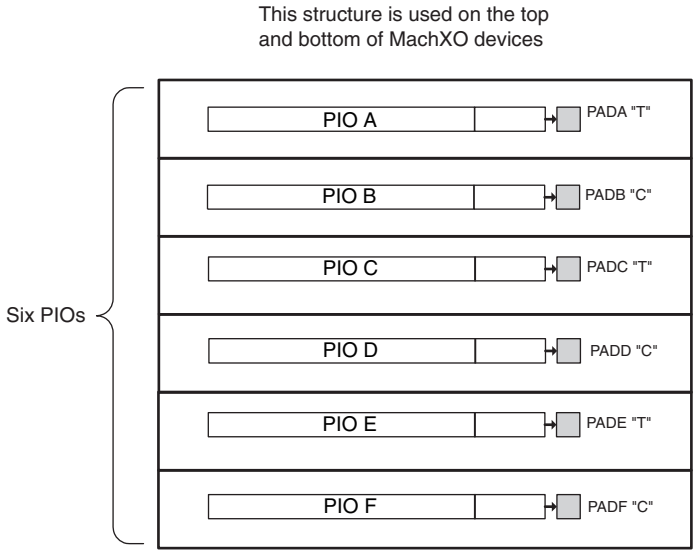

PIO

The PIO blocks provide the interface between the sysIO buffers and the internal PFU array blocks. These blocks receive output data from the PFU array and a fast output data signal from adjacent PFUs. The output data and fast

of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after V_{CC}, V_{CCAUX}, and V_{CCIO} are at valid operating levels and the device has been configured.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

2. **Left and Right sysIO Buffer Pairs**
The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user’s responsibility to ensure that all V_{CCIO} Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to VCCIO. The I/O pins will maintain the blank configuration until VCC, VCCAUX and VCCIO have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore, V_{CCIO} supplies should be powered up before or together with the V_{CC} and V_{CCAUX} supplies

Supported Standards

The MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTL. The buffer supports the LVTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The MachXO1200 and MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of MachXO1200 and MachXO2280 devices. PCI support is provided in the top Banks of the MachXO1200 and MachXO2280 devices. Table 2-8 summarizes the I/O characteristics of the devices in the MachXO family.

Tables 2-9 and 2-10 show the I/O standards (together with their supply and reference voltages) supported by the MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

Figure 2-20. MachXO640 Banks

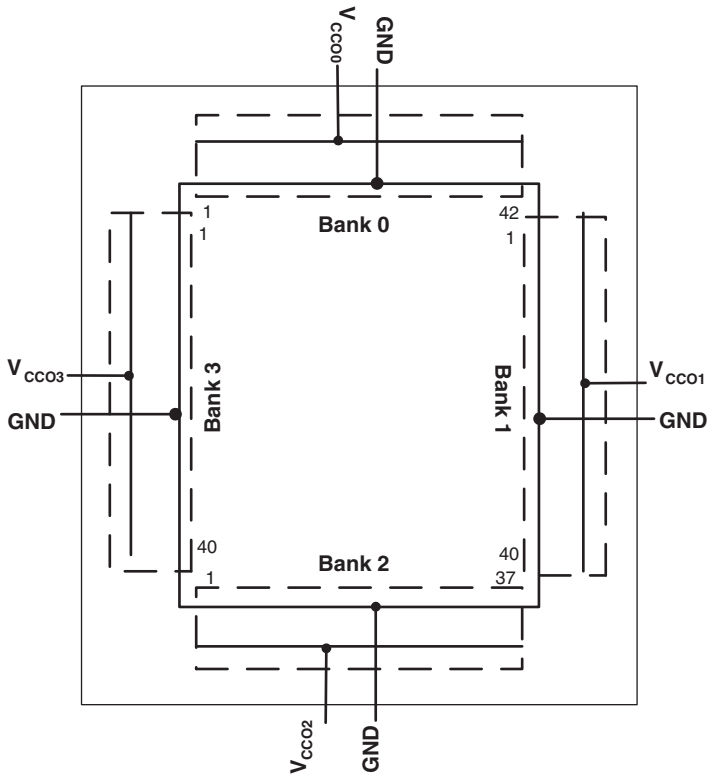

Figure 2-21. MachXO256 Banks

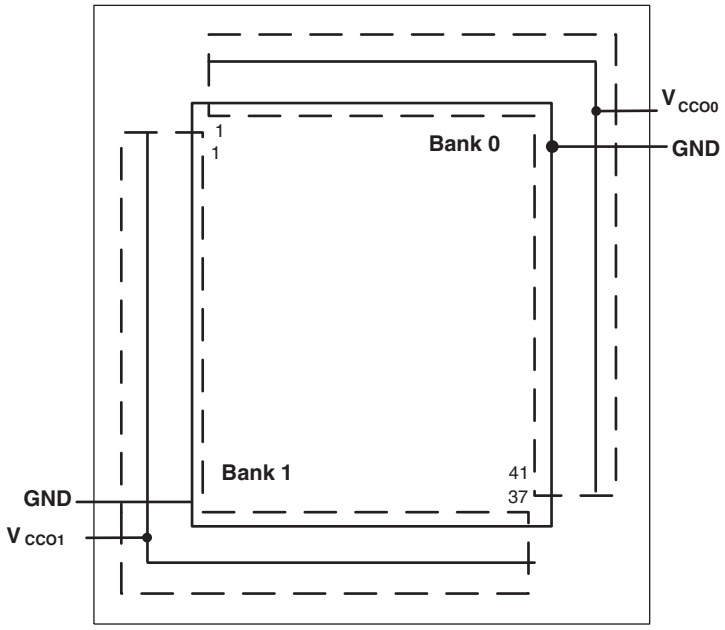

Hot Socketing

The MachXO devices have been carefully designed to ensure predictable behavior during power-up and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of

Absolute Maximum Ratings[1, 2, 3]

	LCMXO E (1.2V)	LCMXO C (1.8V/2.5V/3.3V)
Supply Voltage V_{CC}	-0.5 to 1.32V	-0.5 to 3.75V
Supply Voltage V_{CCAUX}	-0.5 to 3.75V	-0.5 to 3.75V
Output Supply Voltage V_{CCIO}	-0.5 to 3.75V	-0.5 to 3.75V
I/O Tristate Voltage Applied [4]	-0.5 to 3.75V	-0.5 to 3.75V
Dedicated Input Voltage Applied[4]	-0.5 to 3.75V	-0.5 to 4.25V
Storage Temperature (ambient)	-65 to 150°C	-65 to 150°C
Junction Temp. (Tj)	+125°C	+125°C

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice *Thermal Management* document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to (V_{IHMAX} + 2) volts is permitted for a duration of <20ns.

Recommended Operating Conditions[1]

Symbol	Parameter	Min.	Max.	Units
V_{CC}	Core Supply Voltage for 1.2V Devices	1.14	1.26	V
	Core Supply Voltage for 1.8V/2.5V/3.3V Devices	1.71	3.465	V
V_{CCAUX}[3]	Auxiliary Supply Voltage	3.135	3.465	V
V_{CCIO}[2]	I/O Driver Supply Voltage	1.14	3.465	V
t_{JCOM}	Junction Temperature Commercial Operation	0	+85	°C
t_{JIND}	Junction Temperature Industrial Operation	-40	100	°C
$t_{JFLASHCOM}$	Junction Temperature, Flash Programming, Commercial	0	+85	°C
$t_{JFLASHIND}$	Junction Temperature, Flash Programming, Industrial	-40	100	°C

1. Like power supplies must be tied together. For example, if V_{CCIO} and V_{CC} are both 2.5V, they must also be the same supply. 3.3V V_{CCIO} and 1.2V V_{CCIO} should be tied to V_{CCAUX} or 1.2V V_{CC} respectively.
2. See recommended voltages by I/O standard in subsequent table.
3. V_{CC} must reach minimum V_{CC} value before V_{CCAUX} reaches 2.5V.

MachXO Programming/Erase Specifications

Symbol	Parameter	Min.	Max.	Units
$N_{PROGCYC}$	Flash Programming Cycles per $t_{RETENTION}$		1,000	Cycles
	Flash Functional Programming Cycles		10,000	Cycles
$t_{RETENTION}$	Data Retention at 125° Junction Temperature	10		Years

Signal Descriptions

Signal Name	I/O	Descriptions
General Purpose		
P[Edge] [Row/Column Number]_[A/B/C/D/E/F]	I/O	[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top). [Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number. [A/B/C/D/E/F] indicates the PIO within the group to which the pad is connected. Some of these user programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic. During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-up resistor enabled. When the device is erased, I/Os will be tri-stated with an internal pull-up resistor enabled.
GSRN	I	Global RESET signal (active low). Dedicated pad, when not in use it can be used as an I/O pin.
TSALL	I	TSALL is a dedicated pad for the global output enable signal. When TSALL is high all the outputs are tristated. It is a dual function pin. When not in use, it can be used as an I/O pin.
NC	—	No connect.
GND	—	GND - Ground. Dedicated pins.
V_{CC}	—	VCC - The power supply pins for core logic. Dedicated pins.
V_{CCAUX}	—	VCCAUX - the Auxiliary power supply pin. This pin powers up a variety of internal circuits including all the differential and referenced input buffers. Dedicated pins.
V_{CCIOx}	—	V_{CCIO} - The power supply pins for I/O Bank x. Dedicated pins.
SLEEPN[1]	I	Sleep Mode pin - Active low sleep pin.þ When this pin is held high, the device operates normally.þ This pin has a weak internal pull-up, but when unused, an external pull-up to V_{CC} is recommended. When driven low, the device moves into Sleep mode after a specified time.
PLL and Clock Functions (Used as user programmable I/O pins when not used for PLL or clock pins)		
[LOC][0]_PLL[T, C]_IN	—	Reference clock (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
[LOC][0]_PLL[T, C]_FB	—	Optional feedback (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
PCLK [n]_[1:0]	—	Primary Clock Pads, n per side.
Test and Programming (Dedicated pins)		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin -Test Data output pin used to shift data out of the device using 1149.1.

1. Applies to MachXO “C” devices only. NC for “E” devices.

MachXO Family Data Sheet Ordering Information

June 2013 Data Sheet DS1002

Part Number Description

LCMXO XXXX X – X XXXXXX X XX

Device Family
MachXO PLD

Logic Capacity
256 LUTs = 256
640 LUTs = 640
1200 LUTs = 1200
2280 LUTs = 2280

Supply Voltage
C = 1.8V/2.5V/3.3V
E = 1.2V

Note: Parts dual marked as described.

Speed
3 = Slowest
4
5 = Fastest

Package
T100 = 100-pin TQFP
T144 = 144-pin TQFP
M100 = 100-ball csBGA
M132 = 132-ball csBGA
B256 = 256-ball caBGA
FT256 = 256-ball ftBGA
FT324 = 324-ball ftBGA

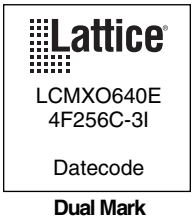
TN100 = 100-pin Lead-Free TQFP
TN144 = 144-pin Lead-Free TQFP
MN100 = 100-ball Lead-Free csBGA
MN132 = 132-ball Lead-Free csBGA
BN256 = 256-ball Lead-Free caBGA
FTN256 = 256-ball Lead-Free ftBGA
FTN324 = 324-ball Lead-Free ftBGA

Grade
C = Commercial
I = Industrial

ES = Engineering Sample
Blank = Production Device

Ordering Information

Note: MachXO devices are dual marked except the slowest commercial speed grade device.þFor example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.þThe slowest commercial speed grade does not have industrial markings.þ The markings appears as follows:



Dual Mark
