## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

|                                |                                                                                                                                                                         |

**Figure 2-6. Distributed Memory Primitives**

**ROM Mode:** The ROM mode uses the same principal as the RAM modes, but without the Write port. Pre-loading is accomplished through the programming interface during configuration.

### PFU Modes of Operation

Slices can be combined within a PFU to form larger functions. Table 2-4 tabulates these modes and documents the functionality possible at the PFU level.

**Table 2-4. PFU Modes of Operation**

| Logic                      | Ripple            | RAM                        | ROM         |
|----------------------------|-------------------|----------------------------|-------------|
| LUT 4x8 or<br>MUX 2x1 x 8  | 2-bit Add x 4     | SPR16x2 x 4<br>DPR16x2 x 2 | ROM16x1 x 8 |
| LUT 5x4 or<br>MUX 4x1 x 4  | 2-bit Sub x 4     | SPR16x4 x 2<br>DPR16x4 x 1 | ROM16x2 x 4 |
| LUT 6x2 or<br>MUX 8x1 x 2  | 2-bit Counter x 4 | SPR16x8 x 1                | ROM16x4 x 2 |
| LUT 7x1 or<br>MUX 16x1 x 1 | 2-bit Comp x 4    |                            | ROM16x8 x 1 |

### Routing

There are many resources provided in the MachXO devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

**Figure 2-8. Primary Clocks for MachXO1200 and MachXO2280 Devices**

Four secondary clocks are generated from four 16:1 muxes as shown in Figure 2-9. Four of the secondary clock sources come from dual function clock pins and 12 come from internal routing.

**Figure 2-9. Secondary Clocks for MachXO Devices**

**Table 2-5. PLL Signal Descriptions**

| Signal       | I/O | Description                                                                                                 |
|--------------|-----|-------------------------------------------------------------------------------------------------------------|
| CLKI         | I   | Clock input from external pin or routing                                                                    |
| CLKFB        | I   | PLL feedback input from PLL output, clock net, routing/external pin or internal feedback from CLKINTFB port |
| RST          | I   | "1" to reset the input clock divider                                                                        |
| CLKOS        | O   | PLL output clock to clock tree (phase shifted/duty cycle changed)                                           |
| CLKOP        | O   | PLL output clock to clock tree (No phase shift)                                                             |
| CLKOK        | O   | PLL output to clock tree through secondary clock divider                                                    |
| LOCK         | O   | "1" indicates PLL LOCK to CLKI                                                                              |
| CLKINTFB     | O   | Internal feedback source, CLKOP divider output before CLOKCTREE                                             |
| DDAMODE      | I   | Dynamic Delay Enable. "1": Pin control (dynamic), "0": Fuse Control (static)                                |
| DDAIZR       | I   | Dynamic Delay Zero. "1": delay = 0, "0": delay = on                                                         |
| DDAILAG      | I   | Dynamic Delay Lag/Lead. "1": Lag, "0": Lead                                                                 |
| DDAIDEL[2:0] | I   | Dynamic Delay Input                                                                                         |

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

## sysMEM Memory

The MachXO1200 and MachXO2280 devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

### sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in Table 2-6.

**Table 2-6. sysMEM Block Configurations**

| Memory Mode      | Configurations                                                           |
|------------------|--------------------------------------------------------------------------|
| Single Port      | 8,192 x 1<br>4,096 x 2<br>2,048 x 4<br>1,024 x 9<br>512 x 18<br>256 x 36 |
| True Dual Port   | 8,192 x 1<br>4,096 x 2<br>2,048 x 4<br>1,024 x 9<br>512 x 18             |
| Pseudo Dual Port | 8,192 x 1<br>4,096 x 2<br>2,048 x 4<br>1,024 x 9<br>512 x 18<br>256 x 36 |
| FIFO             | 8,192 x 1<br>4,096 x 2<br>2,048 x 4<br>1,024 x 9<br>512 x 18<br>256 x 36 |

output data signals are multiplexed and provide a single signal to the I/O pin via the sysIO buffer. Figure 2-17 shows the MachXO PIO logic.

The tristate control signal is multiplexed from the output data signals and their complements. In addition a global signal (TSALL) from a dedicated pad can be used to tristate the sysIO buffer.

The PIO receives an input signal from the pin via the sysIO buffer and provides this signal to the core of the device. In addition there are programmable elements that can be utilized by the design tools to avoid positive hold times.

**Figure 2-17. MachXO PIO Block Diagram**

## sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, TTL, BLVDS, LVDS and LVPECL.

In the MachXO devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS and PCI) are powered using  $V_{CCIO}$ . In addition to the Bank  $V_{CCIO}$  supplies, the MachXO devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that powers up a variety of internal circuits including all the differential and referenced input buffers.

MachXO256 and MachXO640 devices contain single-ended input buffers and single-ended output buffers with complementary outputs on all the I/O Banks.

MachXO1200 and MachXO2280 devices contain two types of sysIO buffer pairs.

### 1. Top and Bottom sysIO Buffer Pairs

The sysIO buffer pairs in the top and bottom Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (for ratioed or absolute input levels). The I/O pairs on the top and bottom

of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$ , and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

## 2. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

### Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when  $V_{CC}$  and  $V_{CCAUX}$  have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all  $V_{CCIO}$  Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to  $V_{CCIO}$ . The I/O pins will maintain the blank configuration until  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The  $V_{CC}$  and  $V_{CCAUX}$  supply the power to the FPGA core fabric, whereas the  $V_{CCIO}$  supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore,  $V_{CCIO}$  supplies should be powered up before or together with the  $V_{CC}$  and  $V_{CCAUX}$  supplies

### Supported Standards

The MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTL. The buffer supports the LVTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3V standards. In the LVCMOS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The MachXO1200 and MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of MachXO1200 and MachXO2280 devices. PCI support is provided in the top Banks of the MachXO1200 and MachXO2280 devices. Table 2-8 summarizes the I/O characteristics of the devices in the MachXO family.

Tables 2-9 and 2-10 show the I/O standards (together with their supply and reference voltages) supported by the MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

**Table 2-10. Supported Output Standards**

| Output Standard                | Drive                | V <sub>CCIO</sub> (Typ.) |
|--------------------------------|----------------------|--------------------------|
| <b>Single-ended Interfaces</b> |                      |                          |
| LVTTTL                         | 4mA, 8mA, 12mA, 16mA | 3.3                      |
| LVC MOS33                      | 4mA, 8mA, 12mA, 14mA | 3.3                      |
| LVC MOS25                      | 4mA, 8mA, 12mA, 14mA | 2.5                      |
| LVC MOS18                      | 4mA, 8mA, 12mA, 14mA | 1.8                      |
| LVC MOS15                      | 4mA, 8mA             | 1.5                      |
| LVC MOS12                      | 2mA, 6mA             | 1.2                      |
| LVC MOS33, Open Drain          | 4mA, 8mA, 12mA, 14mA | —                        |
| LVC MOS25, Open Drain          | 4mA, 8mA, 12mA, 14mA | —                        |
| LVC MOS18, Open Drain          | 4mA, 8mA, 12mA, 14mA | —                        |
| LVC MOS15, Open Drain          | 4mA, 8mA             | —                        |
| LVC MOS12, Open Drain          | 2mA, 6mA             | —                        |
| PCI33 <sup>3</sup>             | N/A                  | 3.3                      |
| <b>Differential Interfaces</b> |                      |                          |
| LVDS <sup>1, 2</sup>           | N/A                  | 2.5                      |
| BLVDS, RSDS <sup>2</sup>       | N/A                  | 2.5                      |
| LVPECL <sup>2</sup>            | N/A                  | 3.3                      |

1. MachXO1200 and MachXO2280 devices have dedicated LVDS buffers.

2. These interfaces can be emulated with external resistors in all devices.

3. Top Banks of MachXO1200 and MachXO2280 devices only.

## sysIO Buffer Banks

The number of Banks vary between the devices of this family. Eight Banks surround the two larger devices, the MachXO1200 and MachXO2280 (two Banks per side). The MachXO640 has four Banks (one Bank per side). The smallest member of this family, the MachXO256, has only two Banks.

Each sysIO buffer Bank is capable of supporting multiple I/O standards. Each Bank has its own I/O supply voltage (V<sub>CCIO</sub>) which allows it to be completely independent from the other Banks. Figure 2-18, Figure 2-18, Figure 2-20 and Figure 2-21 shows the sysIO Banks and their associated supplies for all devices.

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.

2. Assumes all I/O pins are held at  $V_{CCIO}$  or GND.

3. Frequency = 0MHz.

4. Typical user pattern.

5.  $T_J = 25^\circ C$ , power supplies at nominal voltage.

6. Per Bank,  $V_{CCIO} = 2.5V$ . Does not include pull-up/pull-down.

### Programming and Erase Flash Supply Current<sup>1, 2, 3, 4</sup>

| Symbol      | Parameter                                    | Device       | Typ. <sup>5</sup> | Units |

|             |                                              | LCMXO2280C/E | 16                | mA    |
| $I_{CCIO}$  | Bank Power Supply <sup>6</sup>               | All devices  | 2                 | mA    |

1. For further information on supply current, please see details of additional technical documentation at the end of this data sheet.

2. Assumes all I/O pins are held at  $V_{CCIO}$  or GND.

3. Typical user pattern.

4. JTAG programming is at 25MHz.

5.  $T_J = 25^\circ C$ , power supplies at nominal voltage.

6. Per Bank,  $V_{CCIO} = 2.5V$ . Does not include pull-up/pull-down.

## Typical Building Block Function Performance<sup>1</sup>

### Pin-to-Pin Performance (LVCMOS25 12mA Drive)

| Function               | -5 Timing | Units |
|------------------------|-----------|-------|
| <b>Basic Functions</b> |           |       |
| 16-bit decoder         | 6.7       | ns    |
| 4:1 MUX                | 4.5       | ns    |
| 16:1 MUX               | 5.1       | ns    |

### Register-to-Register Performance

| Function                                                      | -5 Timing | Units |
|---------------------------------------------------------------|-----------|-------|
| <b>Basic Functions</b>                                        |           |       |
| 16:1 MUX                                                      | 487       | MHz   |
| 16-bit adder                                                  | 292       | MHz   |
| 16-bit counter                                                | 388       | MHz   |
| 64-bit counter                                                | 200       | MHz   |
| <b>Embedded Memory Functions (1200 and 2280 Devices Only)</b> |           |       |
| 256x36 Single Port RAM                                        | 284       | MHz   |
| 512x18 True-Dual Port RAM                                     | 284       | MHz   |
| <b>Distributed Memory Functions</b>                           |           |       |
| 16x2 Single Port RAM                                          | 434       | MHz   |
| 64x2 Single Port RAM                                          | 320       | MHz   |
| 128x4 Single Port RAM                                         | 261       | MHz   |
| 32x2 Pseudo-Dual Port RAM                                     | 314       | MHz   |
| 64x4 Pseudo-Dual Port RAM                                     | 271       | MHz   |

1. The above timing numbers are generated using the ispLEVER design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

Rev. A 0.19

## Derating Logic Timing

Logic Timing provided in the following sections of the data sheet and the ispLEVER design tools are worst case numbers in the operating range. Actual delays may be much faster. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

## MachXO Internal Timing Parameters<sup>1</sup>

Over Recommended Operating Conditions

| Parameter                                   | Description                                                  | -5    |      | -4    |      | -3    |      | Units |
|---------------------------------------------|--------------------------------------------------------------|-------|------|-------|------|-------|------|-------|

\*Supports true LVDS outputs.

\*\*NC for "E" devices.

\*\*\*Primary clock inputs are single-ended.

## LCMXO640, LCMXO1200 and LCMXO2280 Logic Signal Connections: 144 TQFP (Cont.)

### Part Number Description

Note: Parts dual marked as described.

### Ordering Information

Note: MachXO devices are dual marked except the slowest commercial speed grade device. For example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade. The slowest commercial speed grade does not have industrial markings. The markings appears as follows:

| Part Number        | LUTs | Supply Voltage | I/Os | Grade | Package | Pins | Temp. |
|--------------------|------|----------------|------|-------|---------|------|-------|
| LCMXO2280C-3T100C  | 2280 | 1.8V/2.5V/3.3V | 73   | -3    | TQFP    | 100  | COM   |
