## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM, and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

**Table 2-2. Slice Modes**

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

**Logic Mode:** In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables (LUT4). A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7, and LUT8 can be constructed by concatenating other Slices.

**Ripple Mode:** Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals, Carry Generate and Carry Propagate, are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

**RAM Mode:** In this mode, distributed RAM can be constructed using each LUT block as a 16x2-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The ispLEVER design tool supports the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of Slices required to implement different distributed RAM primitives. Figure 2-6 shows the distributed memory primitive block diagrams. Dual port memories involve the pairing of two Slices. One Slice functions as the read-write port, while the other companion Slice supports the read-only port. For more information on RAM mode in MachXO devices, please see details of additional technical documentation at the end of this data sheet.

**Figure 2-13. Memory Core Reset**

For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

#### EGR Asynchronous Reset

EGR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 2-14. The GSR input to the EGR is always asynchronous.

**Figure 2-14. EGR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EGR asynchronous reset or GSR may only be applied and released after the EGR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EGR clock). The reset release must adhere to the EGR synchronous reset setup time before the next active read or write clock edge.

If an EGR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EGR RAM, ROM and FIFO implementations. For the EGR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 2-14. The reset timing rules apply to the RPReset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPReset are always asynchronous EGR inputs.

Note that there are no reset restrictions if the EGR synchronous reset is used and the EGR GSR input is disabled

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.

2.  $T_A$  25°C,  $f = 1.0MHz$

3. Please refer to  $V_{IL}$  and  $V_{IH}$  in the sysIO Single-Ended DC Electrical Characteristics table of this document.

4. Not applicable to SLEEPN pin.

5. When  $V_{IH}$  is higher than  $V_{CCIO}$ , a transient current typically of 30ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For MachXO1200 and MachXO2280 true LVDS output pins,  $V_{IH}$  must be less than or equal to  $V_{CCIO}$ .

# MachXO Family Data Sheet

## Ordering Information

June 2013

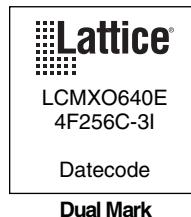

Data Sheet DS1002

### Part Number Description

### Ordering Information

Note: MachXO devices are dual marked except the slowest commercial speed grade device.  
For example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.  
The slowest commercial speed grade does not have industrial markings.  
The markings appears as follows:
