

Welcome to [E-XFL.COM](#)

## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### Details

Product Status	Obsolete
Number of LABs/CLBs	80
Number of Logic Elements/Cells	640
Total RAM Bits	-
Number of I/O	159
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FTBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo640e-4ft256i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lcmxo640e-4ft256i</a>

June 2013

Data Sheet DS1002

### Features

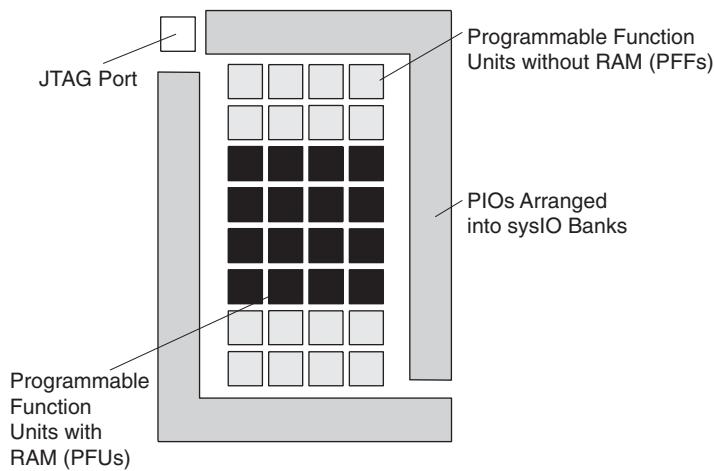

- **Non-volatile, Infinitely Reconfigurable**
  - Instant-on – powers up in microseconds
  - Single chip, no external configuration memory required
  - Excellent design security, no bit stream to intercept
  - Reconfigure SRAM based logic in milliseconds
  - SRAM and non-volatile memory programmable through JTAG port
  - Supports background programming of non-volatile memory
- **Sleep Mode**
  - Allows up to 100x static current reduction
- **TransFR™ Reconfiguration (TFR)**
  - In-field logic update while system operates
- **High I/O to Logic Density**
  - 256 to 2280 LUT4s
  - 73 to 271 I/Os with extensive package options
  - Density migration supported
  - Lead free/RoHS compliant packaging
- **Embedded and Distributed Memory**
  - Up to 27.6 Kbits sysMEM™ Embedded Block RAM
  - Up to 7.7 Kbits distributed RAM
  - Dedicated FIFO control logic

**Table 1-1. MachXO Family Selection Guide**

Device	LCMXO256	LCMXO640	LCMXO1200	LCMXO2280

**Figure 2-3. Top View of the MachXO256 Device**

## PFU Blocks

The core of the MachXO devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM, and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic, and Distributed ROM functions. Except where necessary, the remainder of this data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected Slices, numbered 0-3 as shown in Figure 2-4. There are 53 inputs and 25 outputs associated with each PFU block.

**Figure 2-4. PFU Diagram**

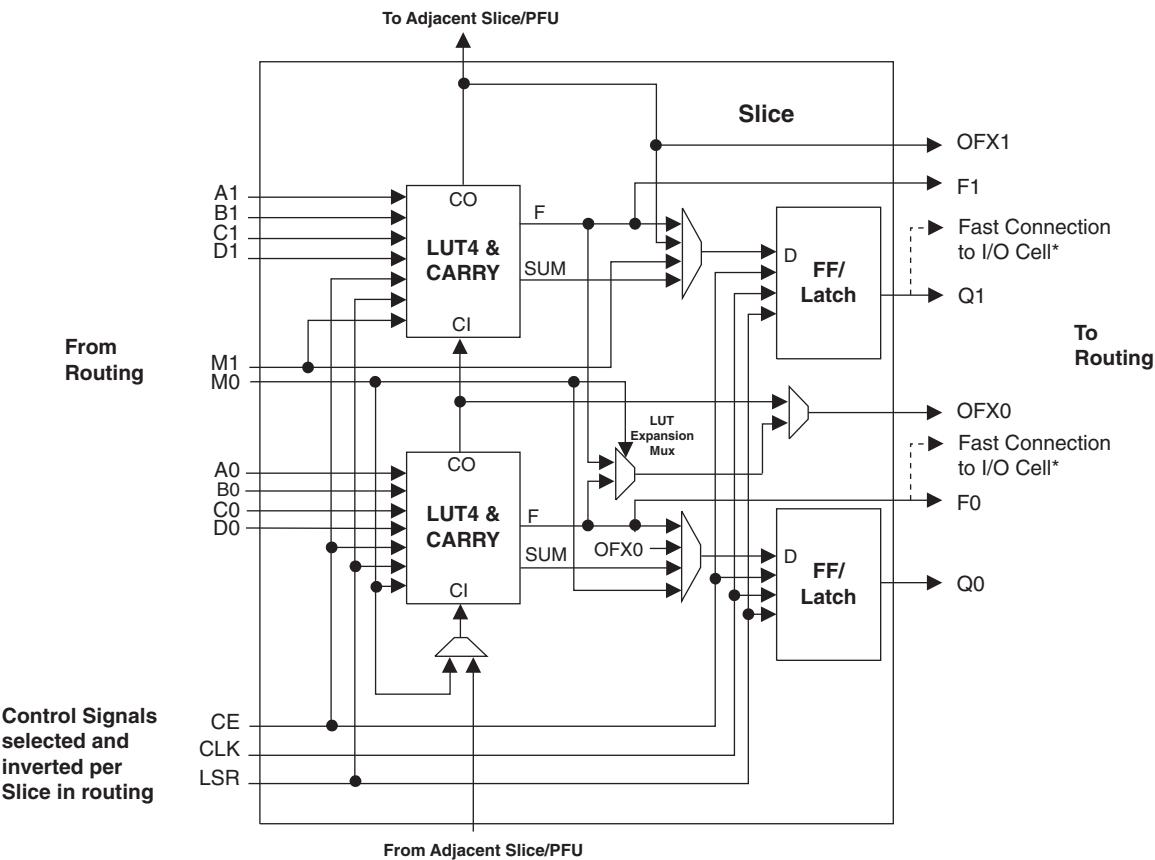

## Slice

Each Slice contains two LUT4 lookup tables feeding two registers (programmed to be in FF or Latch mode), and some associated logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7, and LUT8. There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select, and wider RAM/ROM functions. Figure 2-5 shows an overview of the internal logic of the Slice. The registers in the Slice can be configured for positive/negative and edge/level clocks.

There are 14 input signals: 13 signals from routing and one from the carry-chain (from the adjacent Slice/PFU). There are 7 outputs: 6 to the routing and one to the carry-chain (to the adjacent Slice/PFU). Table 2-1 lists the signals associated with each Slice.

**Figure 2-5. Slice Diagram**

Notes:

Some inter-Slice signals are not shown.

\* Only PFUs at the edges have fast connections to the I/O cell.

**Table 2-1. Slice Signal Descriptions**

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0/M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCIN	Fast Carry In <sup>1</sup>
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8 <sup>2</sup> MUX depending on the Slice
Output	Inter-PFU signal	FCO	Fast Carry Out <sup>1</sup>

1. See Figure 2-4 for connection details.

2. Requires two PFUs.

### Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM, and ROM. The Slice in the PFF is capable of all modes except RAM. Table 2-2 lists the modes and the capability of the Slice blocks.

**Table 2-2. Slice Modes**

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

**Logic Mode:** In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables (LUT4). A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7, and LUT8 can be constructed by concatenating other Slices.

**Ripple Mode:** Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals, Carry Generate and Carry Propagate, are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

**RAM Mode:** In this mode, distributed RAM can be constructed using each LUT block as a 16x2-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The ispLEVER design tool supports the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 2-3 shows the number of Slices required to implement different distributed RAM primitives. Figure 2-6 shows the distributed memory primitive block diagrams. Dual port memories involve the pairing of two Slices. One Slice functions as the read-write port, while the other companion Slice supports the read-only port. For more information on RAM mode in MachXO devices, please see details of additional technical documentation at the end of this data sheet.

**Table 2-3. Number of Slices Required For Implementing Distributed RAM**

	SPR16x2	DPR16x2
Number of Slices	1	2

Note: SPR = Single Port RAM, DPR = Dual Port RAM

## sysCLOCK Phase Locked Loops (PLLs)

The MachXO1200 and MachXO2280 provide PLL support. The source of the PLL input divider can come from an external pin or from internal routing. There are four sources of feedback signals to the feedback divider: from CLKINTFB (internal feedback port), from the global clock nets, from the output of the post scalar divider, and from the routing (or from an external pin). There is a PLL\_LOCK signal to indicate that the PLL has locked on to the input clock signal. Figure 2-10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the  $t_{LOCK}$  parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider, and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

**Figure 2-10. PLL Diagram**

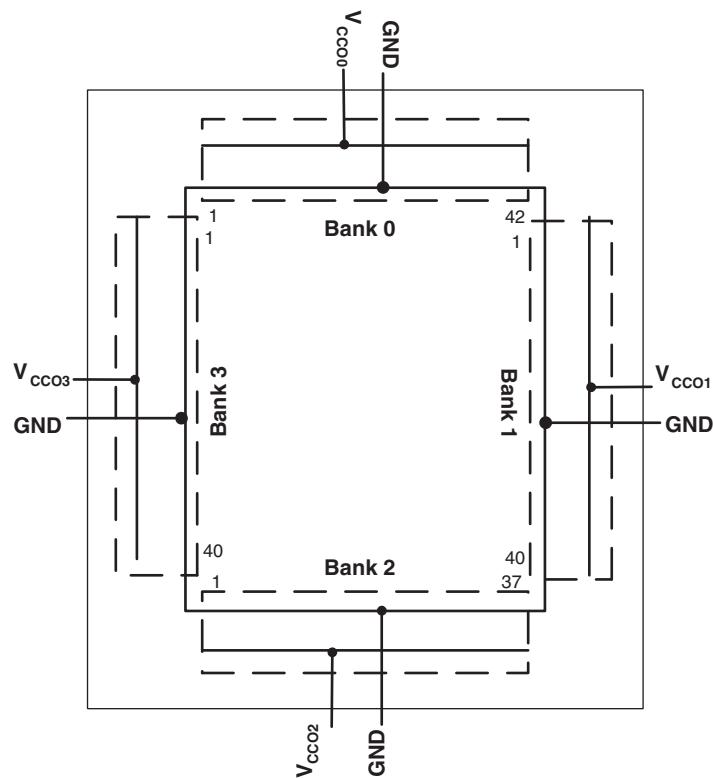

Figure 2-11 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

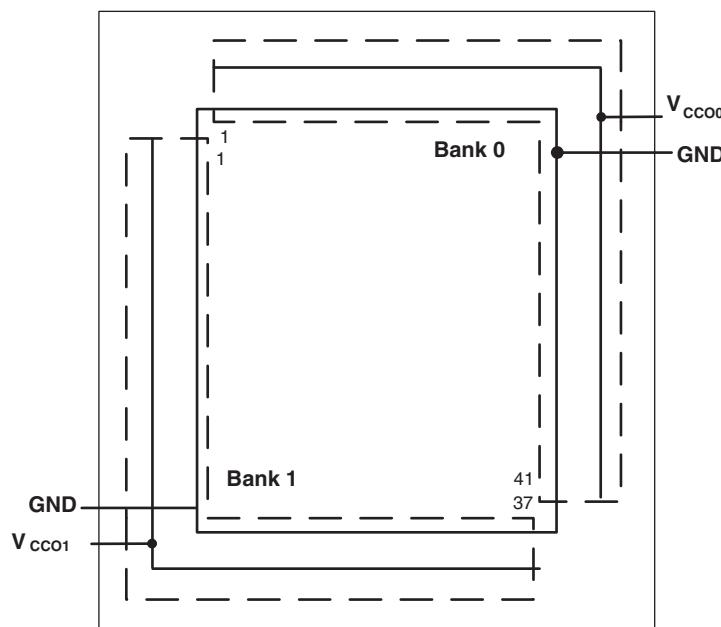

**Figure 2-11. PLL Primitive**

**Figure 2-20. MachXO640 Banks**

**Figure 2-21. MachXO256 Banks**

## Hot Socketing

The MachXO devices have been carefully designed to ensure predictable behavior during power-up and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of

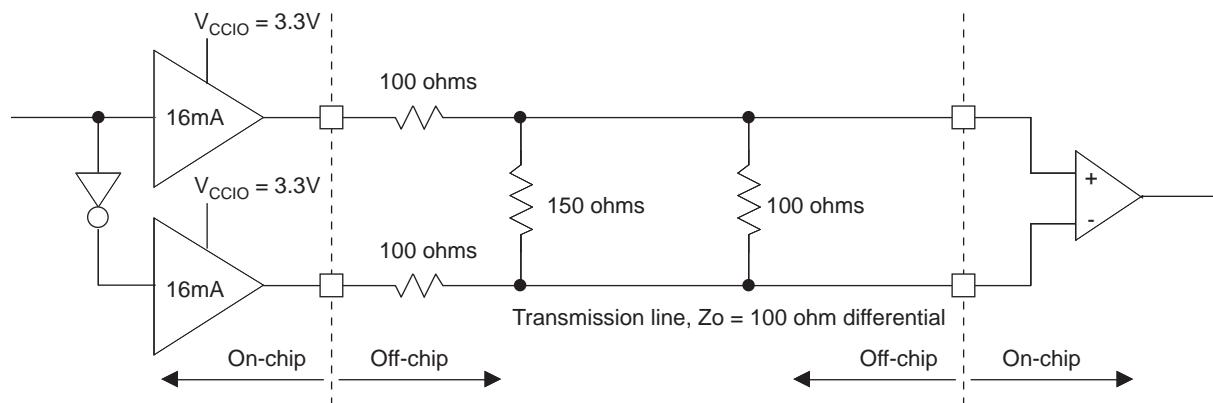

**Table 3-2. BLVDS DC Conditions<sup>1</sup>**
**Over Recommended Operating Conditions**

Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
Z <sub>OUT</sub>	Output impedance	100	100	Ohms
R <sub>TLEFT</sub>	Left end termination	45	90	Ohms
R <sub>TRIGHT</sub>	Right end termination	45	90	Ohms
V <sub>OH</sub>	Output high voltage	1.375	1.48	V
V <sub>OL</sub>	Output low voltage	1.125	1.02	V
V <sub>OD</sub>	Output differential voltage	0.25	0.46	V
V <sub>CM</sub>	Output common mode voltage	1.25	1.25	V
I <sub>DC</sub>	DC output current	11.2	10.2	mA

1. For input buffer, see LVDS table.

## LVPECL

The MachXO family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.

**Figure 3-3. Differential LVPECL**

**Table 3-3. LVPECL DC Conditions<sup>1</sup>**
**Over Recommended Operating Conditions**

Symbol	Description	Nominal	Units
Z <sub>OUT</sub>	Output impedance	100	Ohms
R <sub>P</sub>	Driver parallel resistor	150	Ohms
R <sub>T</sub>	Receiver termination	100	Ohms
V <sub>OH</sub>	Output high voltage	2.03	V
V <sub>OL</sub>	Output low voltage	1.27	V
V <sub>OD</sub>	Output differential voltage	0.76	V
V <sub>CM</sub>	Output common mode voltage	1.65	V
Z <sub>BACK</sub>	Back impedance	85.7	Ohms
I <sub>DC</sub>	DC output current	12.7	mA

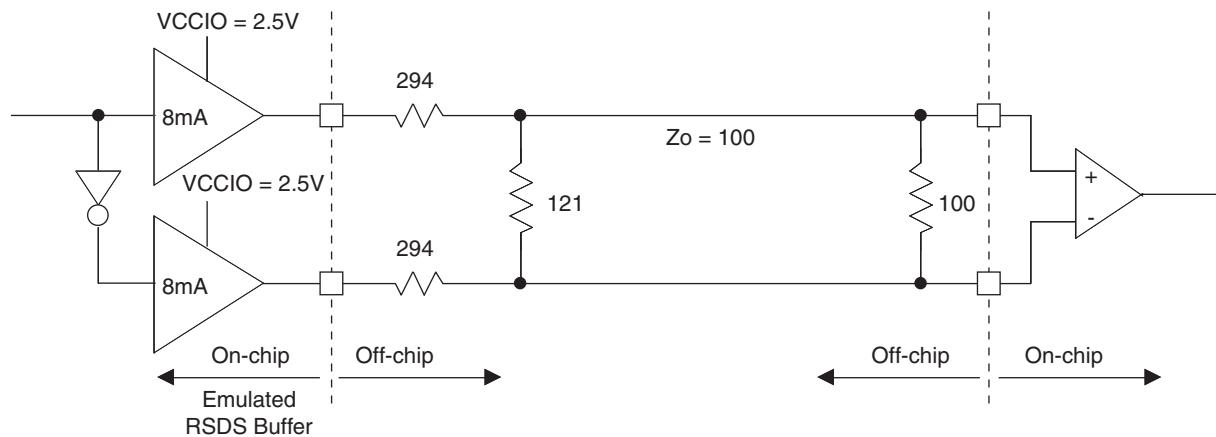

1. For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

## RSDS

The MachXO family supports the differential RSDS standard. The output standard is emulated using complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3-4 is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in Figure 3-4 are industry standard values for 1% resistors.

**Figure 3-4. RSDS (Reduced Swing Differential Standard)**

**Table 3-4. RSDS DC Conditions**

Parameter	Description	Typical	Units
$Z_{OUT}$	Output impedance	20	Ohms
$R_S$	Driver series resistor	294	Ohms
$R_P$	Driver parallel resistor	121	Ohms
$R_T$	Receiver termination	100	Ohms
$V_{OH}$	Output high voltage	1.35	V
$V_{OL}$	Output low voltage	1.15	V
$V_{OD}$	Output differential voltage	0.20	V
$V_{CM}$	Output common mode voltage	1.25	V
$Z_{BACK}$	Back impedance	101.5	Ohms
$I_{DC}$	DC output current	3.66	mA

NC <sup>4</sup>			—

1. Pin orientation follows the conventional order from pin 1 marking of the top side view and counter-clockwise.
2. Pin orientation A1 starts from the upper left corner of the top side view with alphabetical order ascending vertically and numerical order ascending horizontally.
3. All grounds must be electrically connected at the board level. For fpBGA and ftBGA packages, the total number of GND balls is less than the actual number of GND logic connections from the die to the common package GND plane.
4. NC pins should not be connected to any active signals, VCC or GND.

# MachXO Family Data Sheet Ordering Information

June 2013

Data Sheet DS1002

## **Part Number Description**

Note: Parts dual marked as described.

ES = Engineering Sample  
Blank = Production Device

Grade

C = Commercial  
I = Industrial

## Package

T100 = 100-pin TQFP  
T144 = 144-pin TQFP  
M100 = 100-ball csBGA  
M132 = 132-ball csBGA  
B256 = 256-ball caBGA  
FT256 = 256-ball ftBGA  
FT324 = 324-ball ftBGA

TN100 = 100-pin Lead-Free TQFP  
TN144 = 144-pin Lead-Free TQFP  
MN100 = 100-ball Lead-Free csBGA  
MN132 = 132-ball Lead-Free csBGA  
BN256 = 256-ball Lead-Free cbBGA  
FTN256 = 256-ball Lead-Free ftBGA  
FTN324 = 324-ball Lead-Free ftBGA

## Speed

3 = Slowest  
4  
5 = Fastest

## **Ordering Information**

Note: MachXO devices are dual marked except the slowest commercial speed grade device.  
For example the commercial speed grade LCMXO640E-4F256C is also marked with industrial grade -3I grade.  
The slowest commercial speed grade does not have industrial markings.  
The markings appears as follows:

Part Number	LUTs	Supply Voltage	I/Os	Grade	Package	Pins	Temp.
LCMxo1200E-3T100C	1200	1.2V	73	-3	TQFP	100	COM
LCMxo1200E-4T100C	1200	1.2V	73	-4	TQFP	100	COM
