Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	AC'97, Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	85
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 32x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-TQFP
Supplier Device Package	100-TQFP (12x12)

5.4.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

The user can program one row of program Flash memory at a time. To do this, it is necessary to erase the 8-row erase page that contains the desired row. The general process is:

1. Read eight rows of program memory (512 instructions) and store in data RAM.
2. Update the program data in RAM with the desired new data.
3. Erase the block (see Example 5-1):
   a) Set the NVMOP bits (NVMCON<3:0>) to '0010' to configure for block erase. Set the ERASE bit (NVMCON<6>) and the WREN bit (NVMCON<14>).
   b) Write the starting address of the page to be erased into the TBLPAG and W registers.
   c) Write 0x55 to NVMKEY.
   d) Write 0xAA to NVMKEY.
   e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.
4. Write the first 64 instructions from data RAM into the program memory buffers (see Example 5-2).
5. Write the program block to Flash memory:
   a) Set the NVMOP bits to '0001' to configure for row programming. Clear the ERASE bit and set the WREN bit.
   b) Write 0x55 to NVMKEY.
   c) Write 0xAA to NVMKEY.
   d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.
6. Repeat steps 4 and 5, using the next available 64 instructions from the block in data RAM by incrementing the value in TBLPAG, until all 512 instructions are written back to Flash memory.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs, as shown in Example 5-3.

APPENDIX B: REVISION HISTORY

Revision A (April 2009)

This is the initial released version of the document.

Revision B (October 2009)

The revision includes the following global update:

- Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE B-1: MAJOR SECTION UPDATES

Section Name	Update Description
"High-Performance, 16-Bit Digital Signal Controllers"	Added information on high temperature operation (see **"Operating Range"**).
Section 10.0 "Power-Saving Features"	Updated the last paragraph to clarify the number of cycles that occur prior to the start of instruction execution (see **Section 10.2.2 "Idle Mode"**).
Section 11.0 "I/O Ports"	Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of **Section 11.2 "Open-Drain Configuration"**.
Section 18.0 "Universal Asynchronous Receiver Transmitter (UART)"	Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS.
Section 21.0 "10-Bit/12-Bit Analog-to-Digital Converter (ADC)"	Updated the ADCx block diagram (see Figure 21-1).
Section 22.0 "Special Features"	Updated the second paragraph and removed the fourth paragraph in **Section 22.1 "Configuration Bits"**. Updated the Device Configuration Register Map (see Table 22-1). Added the FPWRT<2:0> bit field for the FWDT register to the Configurative Bits Description table (see Table 22-1).
Section 25.0 "Electrical Characteristics"	Updated the Absolute Maximum Ratings for high temperature and added Note 4. Updated Power-Down Current parameters DC60d, DC60a, DC60b, and DC60d (see Table 25-7). Added I2Cx Bus Data Timing Requirements (Master Mode) parameter IM51 (see Table 25-36). Updated the SPIx Module Slave Mode (CKE = 1) Timing Characteristics (see Figure 25-12). Updated the Internal LPRC Accuracy parameters (see Table 25-19). Updated the ADC Module Specifications (12-bit Mode) parameters AD23a and AD24a (see Table 25-42). Updated the ADC Module Specifications (10-bit Mode) parameters AD23b and AD24b (see Table 25-43).
Section 26.0 "High Temperature Electrical Characteristics"	Added new chapter with high temperature specifications.
"Product Identification System"	Added the "H" definition for high temperature.
