What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33FJXXXGPX06A/X08A/X10A family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 3. "Data Memory"** (DS70202) and **Section 4. "Program Memory"** (DS70203) in the *"dsPIC33F/PIC24H Family Reference Manual"*, which are available from the Microchip web site (www.microchip.com).

The dsPIC33FJXXXGPX06A/X08A/X10A architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

FIGURE 4-1: PROGRAM MEMORY FOR dsPIC33FJXXXGPX06A/X08A/X10A DEVICES

4.1 Program Address Space

The program address memory space of the dsPIC33FJXXXGPX06A/X08A/X10A devices is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in **Section 4.6 "Interfacing Program and Data Memory Spaces"**.

User access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space. Memory usage for the dsPIC33FJXXXGPX06A/X08A/X10A of devices is shown in Figure 4-1.

- 2:** Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.
- 3:** TDPU is the time required for the ADC module to stabilize when it is turned on (AD1CON1<ADON> = 1). During this time, the ADC result is indeterminate.

26.0 HIGH TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJXXXGPX06A/X08A/X10A electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in **Section 25.0 “Electrical Characteristics”** for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, parameter DC10 in **Section 25.0 “Electrical Characteristics”** is the Industrial and Extended temperature equivalent of HDC10.

Absolute maximum ratings for the dsPIC33FJXXXGPX06A/X08A/X10A high temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings

(See Note 1)

Ambient temperature under bias ⁽⁴⁾	-40°C to +150°C
Storage temperature	-65°C to +160°C
Voltage on VDD with respect to Vss	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to Vss ⁽⁵⁾	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to Vss when VDD < 3.0V ⁽⁵⁾	-0.3V to (VDD + 0.3V)
Voltage on any 5V tolerant pin with respect to Vss when VDD ≥ 3.0V ⁽⁵⁾	-0.3V to 5.6V
Voltage on VCAP with respect to Vss	2.25V to 2.75V
Maximum current out of Vss pin	60 mA
Maximum current into VDD pin ⁽²⁾	60 mA
Maximum junction temperature	+155°C
Maximum current sourced/sunk by any 2x I/O pin ⁽³⁾	2 mA
Maximum current sourced/sunk by any 4x I/O pin ⁽³⁾	4 mA
Maximum current sourced/sunk by any 8x I/O pin ⁽³⁾	8 mA
Maximum current sunk by all ports combined	10 mA
Maximum current sourced by all ports combined ⁽²⁾	10 mA

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

- 2: Maximum allowable current is a function of device maximum power dissipation (see Table 26-2).
- 3: Unlike devices at 125°C and below, the specifications in this section also apply to the CLKOUT, VREF+, VREF-, SCLx, SDAx, PGECx, and PGEDx pins.
- 4: AEC-Q100 reliability testing for devices intended to operate at 150°C is 1,000 hours. Any design in which the total operating time from 125°C to 150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.
- 5: Refer to the “Pin Diagrams” section for 5V tolerant pins.
