

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	32MHz
Connectivity	I <sup>2</sup> C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	25
Program Memory Size	7KB (4K x 14)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 24x10b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-UQFN Exposed Pad
Supplier Device Package	28-UQFN (4x4)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16lf18854-i-mv">https://www.e-xfl.com/product-detail/microchip-technology/pic16lf18854-i-mv</a>

# PIC16(L)F18854

---

## Digital Peripherals (Cont.)

- Cyclical Redundancy Check (CRC/SCAN):
  - 16-bit CRC
  - Scans memory for NVM integrity
- Communication:
  - EUSART, RS-232, RS-485, LIN compatible
  - Two SPI
  - Two I<sup>2</sup>C, SMBus, PMBus™ compatible
- Up to 25 I/O Pins:
  - Individually programmable pull-ups
  - Slew rate control
  - Interrupt-on-change with edge-select
  - Input level selection control (ST or TTL)
  - Digital open-drain enable
  - Current mode enable
- Peripheral Pin Select (PPS):
  - Enables pin mapping of digital I/O
- Data Signal Modulator (DSM)
  - Modulates a carrier signal with digital data to create custom carrier synchronized output waveforms

## Analog Peripherals

- Analog-to-Digital Converter with Computation (ADC<sup>2</sup>):
  - 10-bit with up to 24 external channels
  - Automated post-processing
  - Automates math functions on input signals: averaging, filter calculations, oversampling and threshold comparison
  - Operates in Sleep
- Two Comparators (COMP):
  - Fixed Voltage Reference at (non) inverting input(s)
  - Comparator outputs externally accessible
- 5-Bit Digital-to-Analog Converter (DAC):
  - 5-bit resolution, rail-to-rail
  - Positive Reference Selection
  - Unbuffered I/O pin output
  - Internal connections to ADCs and comparators
- Voltage Reference:
  - Fixed Voltage Reference with 1.024V, 2.048V and 4.096V output levels

## Flexible Oscillator Structure

- High-Precision Internal Oscillator:
  - Software selectable frequency range up to 32 MHz, ±1% typical
- x2/x4 PLL with Internal and External Sources
- Low-Power Internal 32 kHz Oscillator (LFINTOSC)
- External 32 kHz Crystal Oscillator (SOSC)
- External Oscillator Block with:
  - Three crystal/resonator modes up to 20 MHz
  - Three external clock modes up to 20 MHz
- Fail-Safe Clock Monitor:
  - Allows for safe shutdown if peripheral clock stops
- Oscillator Start-up Timer (OST)
  - Ensures stability of crystal oscillator resources

# PIC16(L)F18854

## 3.1.1.2 Indirect Read with FSR

The program memory can be accessed as data by setting bit 7 of the FSRxH register and reading the matching INDFx register. The `MOVIW` instruction will place the lower eight bits of the addressed word in the W register. Writes to the program memory cannot be performed via the INDF registers. Instructions that access the program memory via the FSR require one extra instruction cycle to complete. Example 3-2 demonstrates accessing the program memory via an FSR.

The `HIGH` directive will set bit 7 if a label points to a location in the program memory.

### EXAMPLE 3-2: ACCESSING PROGRAM MEMORY VIA FSR

```
constants
    RETLW DATA0      ;Index0 data
    RETLW DATA1      ;Index1 data
    RETLW DATA2
    RETLW DATA3
my_function
    ;... LOTS OF CODE...
    MOVLW LOW constants
    MOVWF FSR1L
    MOVLW HIGH constants
    MOVWF FSR1H
    MOVIW 0[FSR1]
;THE PROGRAM MEMORY IS IN W
```

## 3.2.1 CORE REGISTERS

The core registers contain the registers that directly affect the basic operation. The core registers occupy the first 12 addresses of every data memory bank (addresses `x00h/x08h` through `x0Bh/x8Bh`). These registers are listed below in Table 3-2. For detailed information, see Table 3-10.

TABLE 3-2: CORE REGISTERS

Addresses	BANKx
<code>x00h</code> or <code>x80h</code>	INDF0
<code>x01h</code> or <code>x81h</code>	INDF1
<code>x02h</code> or <code>x82h</code>	PCL
<code>x03h</code> or <code>x83h</code>	STATUS
<code>x04h</code> or <code>x84h</code>	FSR0L
<code>x05h</code> or <code>x85h</code>	FSR0H
<code>x06h</code> or <code>x86h</code>	FSR1L
<code>x07h</code> or <code>x87h</code>	FSR1H
<code>x08h</code> or <code>x88h</code>	BSR
<code>x09h</code> or <code>x89h</code>	WREG
<code>x0Ah</code> or <code>x8Ah</code>	PCLATH
<code>x0Bh</code> or <code>x8Bh</code>	INTCON

## 3.2 Data Memory Organization

The data memory is partitioned into 32 memory banks with 128 bytes in each bank. Each bank consists of (Figure 3-2):

- 12 core registers
- 20 Special Function Registers (SFR)
- Up to 80 bytes of General Purpose RAM (GPR)
- 16 bytes of common RAM

The active bank is selected by writing the bank number into the Bank Select Register (BSR). Unimplemented memory will read as '0'. All data memory can be accessed either directly (via instructions that use the file registers) or indirectly via the two File Select Registers (FSR). See **Section 3.5 "Indirect Addressing"** for more information.

Data memory uses a 12-bit address. The upper five bits of the address define the Bank address and the lower seven bits select the registers/RAM in that bank.

## REGISTER 7-12: PIR1: PERIPHERAL INTERRUPT REQUEST REGISTER 1

R/W/HS-0/0	R/W/HS-0/0	U-0	U-0	U-0	U-0	R/W/HS-0/0	R/W/HS-0/0
OSFIF	CSWIF	—	—	—	—	ADTIF	ADIF
bit 7						bit 0	

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	HS = Hardware set

- bit 7      **OSFIF:** Oscillator Fail-Safe Interrupt Flag bit  
 1 = Oscillator fail-safe interrupt has occurred (must be cleared in software)  
 0 = No oscillator fail-safe interrupt
- bit 6      **CSWIF:** Clock Switch Complete Interrupt Flag bit  
 1 = The clock switch module indicates an interrupt condition (must be cleared in software)  
 0 = The clock switch does not indicate an interrupt condition
- bit 5-2    **Unimplemented:** Read as '0'
- bit 1      **ADTIF:** Analog-to-Digital Converter (ADC) Threshold Compare Interrupt Flag bit  
 1 = An A/D measurement was beyond the configured threshold (must be cleared in software)  
 0 = A/D measurements have been within the configured threshold
- bit 0      **ADIF:** Analog-to-Digital Converter (ADC) Interrupt Flag bit  
 1 = An A/D conversion or complex operation has completed (must be cleared in software)  
 0 = An A/D conversion or complex operation is not complete

**Note:** Interrupt flag bits are set when an interrupt condition occurs, regardless of the state of its corresponding enable bit or the Global Enable bit, GIE, of the INTCON register. User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

bit 7							bit 0

### Legend:

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
u = Bit is unchanged                  x = Bit is unknown                    -n/n = Value at POR and BOR/Value at all other Resets  
'1' = Bit is set                        '0' = Bit is cleared

bit 7-0                      **ACC<7:0>**: CRC Accumulator Register bits  
Writing to this register writes to the CRC accumulator register through the CRC write bus. Reading from this register reads the CRC accumulator.

# PIC16(L)F18854

## REGISTER 11-12: SCANLADRH: SCAN LOW ADDRESS HIGH BYTE REGISTER

R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0
LADR<15:8> <sup>(1,2)</sup>							
bit 7							bit 0

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7-0      **LADR<15:8>**: Scan Start/Current Address bits<sup>(1,2)</sup>  
Most Significant bits of the current address to be fetched from, value increments on each fetch of memory.

- Note 1:** Registers SCANLADRH/L form a 16-bit value, but are not guarded for atomic or asynchronous access; registers should only be read or written while SCANGO = 0 (SCANCON0 register).  
**2:** While SCANGO = 1 (SCANCON0 register), writing to this register is ignored.

## REGISTER 11-13: SCANLADRL: SCAN LOW ADDRESS LOW BYTE REGISTER

R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0	R/W-0/0
LADR<7:0> <sup>(1,2)</sup>							
bit 7							bit 0

### Legend:

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7-0      **LADR<7:0>**: Scan Start/Current Address bits<sup>(1,2)</sup>  
Least Significant bits of the current address to be fetched from, value increments on each fetch of memory

- Note 1:** Registers SCANLADRH/L form a 16-bit value, but are not guarded for atomic or asynchronous access; registers should only be read or written while SCANGO = 0 (SCANCON0 register).  
**2:** While SCANGO = 1 (SCANCON0 register), writing to this register is ignored.

# PIC16(L)F18854

## REGISTER 12-25: ANSELC: PORTC ANALOG SELECT REGISTER

R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1

bit 7							bit 0

### Legend:

R = Readable bit                      W = Writable bit                      U = Unimplemented bit, read as '0'  
u = Bit is unchanged                  x = Bit is unknown                  -n/n = Value at POR and BOR/Value at all other Resets  
'1' = Bit is set                          '0' = Bit is cleared

bit 7-0            **WPUC<7:0>**: Weak Pull-up Register bits<sup>(1)</sup>  
1 = Pull-up enabled  
0 = Pull-up disabled

**Note 1:** The weak pull-up device is automatically disabled if the pin is configured as an output.

# PIC16(L)F18854

## 18.12 Register Definitions: Comparator Control

**REGISTER 18-1: CMxCON0: COMPARATOR Cx CONTROL REGISTER 0**

R/W-0/0	R-0/0	U-0	R/W-0/0	U-0	U-0	R/W-0/0	R/W-0/0
ON	OUT	—	POL	—	—	HYS	SYNC
bit 7						bit 0	

**Legend:**

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

- bit 7      **ON:** Comparator Enable bit  
           1 = Comparator is enabled  
           0 = Comparator is disabled and consumes no active power
- bit 6      **OUT:** Comparator Output bit  
           If CxPOL = 1 (inverted polarity):  
           1 = CxVP < CxVN  
           0 = CxVP > CxVN  
           If CxPOL = 0 (non-inverted polarity):  
           1 = CxVP > CxVN  
           0 = CxVP < CxVN
- bit 5      **Unimplemented:** Read as '0'
- bit 4      **POL:** Comparator Output Polarity Select bit  
           1 = Comparator output is inverted  
           0 = Comparator output is not inverted
- bit 3-2    **Unimplemented:** Read as '0'
- bit 1      **HYS:** Comparator Hysteresis Enable bit  
           1 = Comparator hysteresis enabled  
           0 = Comparator hysteresis disabled
- bit 0      **SYNC:** Comparator Output Synchronous Mode bit  
           1 = Comparator output to Timer1 and I/O pin is synchronous to changes on Timer1 clock source.  
               Output updated on the falling edge of Timer1 clock source.  
           0 = Comparator output to Timer1 and I/O pin is asynchronous

# PIC16(L)F18854

## 22.0 CONFIGURABLE LOGIC CELL (CLC)

The Configurable Logic Cell (CLCx) module provides programmable logic that operates outside the speed limitations of software execution. The logic cell takes up to 32 input signals and, through the use of configurable gates, reduces the 32 inputs to four logic lines that drive one of eight selectable single-output logic functions.

Input sources are a combination of the following:

- I/O pins
- Internal clocks
- Peripherals
- Register bits

The output can be directed internally to peripherals and to an output pin.

The CLC modules available are shown in Table 22-1.

**TABLE 22-1: AVAILABLE CLC MODULES**

Device	CLC1	CLC2	CLC3	CLC4
PIC16(L)F18854	•	•	•	•

**Note:** The CLC1, CLC2, CLC3 and CLC4 are four separate module instances of the same CLC module design. Throughout this section, the lower case 'x' in register and bit names is a generic reference to the CLC number (which should be substituted with 1, 2, 3, or 4 during code development). For example, the control register is generically described in this chapter as CLCxCON, but the actual device registers are CLC1CON, CLC2CON, CLC3CON and CLC4CON. Similarly, the LCxEN bit represents the LC1EN, LC2EN, LC3EN and LC4EN bits.

Refer to Figure 22-1 for a simplified diagram showing signal flow through the CLCx.

Possible configurations include:

- Combinatorial Logic
  - AND
  - NAND
  - AND-OR
  - AND-OR-INVERT
  - OR-XOR
  - OR-XNOR
- Latches
  - S-R
  - Clocked D with Set and Reset
  - Transparent D with Set and Reset
  - Clocked J-K with Reset

# PIC16(L)F18854

Using the Auto-conversion Trigger does not assure proper ADC timing. It is the user's responsibility to ensure that the ADC timing requirements are met. See Table 23-2 for auto-conversion sources.

**TABLE 23-2: ADC AUTO-CONVERSION TABLE**

ADACT Value	Sour0x1Dce Peripher0x1Dal	Description
0x00	Disabled	External Trigger Disabled
0x01	ADACTPPS	Pin selected by ADACTPPS
0x02	TMR0	Timer0 overflow condition
0x03	TMR1	Timer1 overflow condition
0x04	TMR2	Match between Timer2 postscaled value and PR2
0x05	TMR3	Timer3 overflow condition
0x06	TMR4	Match between Timer4 postscaled value and PR4
0x07	TMR5	Timer5 overflow condition
0x08	TMR6	Match between Timer6 postscaled value and PR6
0x09	SMT1	Match between SMT1 and SMT1PR
0x0A	SMT2	Match between SMT2 and SMT2PR
0x0B	CCP1	CCP1 output
0x0C	CCP2	CCP2 output
0x0D	CCP3	CCP3 output

## 29.5.6 EDGE-TRIGGERED ONE-SHOT MODE

The Edge-Triggered One-Shot modes start the timer on an edge from the external signal input, after the ON bit is set, and clear the ON bit when the timer matches the PRx period value. The following edges will start the timer:

- Rising edge (MODE<4:0> = 01001)
- Falling edge (MODE<4:0> = 01010)
- Rising or Falling edge (MODE<4:0> = 01011)

If the timer is halted by clearing the ON bit then another TMRx\_ers edge is required after the ON bit is set to resume counting. Figure 29-9 illustrates operation in the rising edge One-Shot mode.

When Edge-Triggered One-Shot mode is used in conjunction with the CCP then the edge-trigger will activate the PWM drive and the PWM drive will deactivate when the timer matches the CCPRx pulse width value and stay deactivated when the timer halts at the PRx period count match.

**FIGURE 29-9: EDGE-TRIGGERED ONE-SHOT MODE TIMING DIAGRAM (MODE = 01001)**

## 29.5.7 EDGE-TRIGGERED HARDWARE LIMIT ONE-SHOT MODE

In Edge-Triggered Hardware Limit One-Shot modes the timer starts on the first external signal edge after the ON bit is set and resets on all subsequent edges. Only the first edge after the ON bit is set is needed to start the timer. The counter will resume counting automatically two clocks after all subsequent external Reset edges. Edge triggers are as follows:

- Rising edge start and Reset (MODE<4:0> = 01100)
- Falling edge start and Reset (MODE<4:0> = 01101)

The timer resets and clears the ON bit when the timer value matches the PRx period value. External signal edges will have no effect until after software sets the ON bit. Figure 29-10 illustrates the rising edge hardware limit one-shot operation.

When this mode is used in conjunction with the CCP then the first starting edge trigger, and all subsequent Reset edges, will activate the PWM drive. The PWM drive will deactivate when the timer matches the CCPRx pulse-width value and stay deactivated until the timer halts at the PRx period match unless an external signal edge resets the timer before the match occurs.

# PIC16(L)F18854

## 31.4 I<sup>2</sup>C MODE OPERATION

All MSSP I<sup>2</sup>C communication is byte oriented and shifted out MSb first. Six SFR registers and two interrupt flags interface the module with the PIC<sup>®</sup> microcontroller and user software. Two pins, SDA and SCL, are exercised by the module to communicate with other external I<sup>2</sup>C devices.

### 31.4.1 BYTE FORMAT

All communication in I<sup>2</sup>C is done in 9-bit segments. A byte is sent from a master to a slave or vice-versa, followed by an Acknowledge bit sent back. After the eighth falling edge of the SCL line, the device outputting data on the SDA changes that pin to an input and reads in an acknowledge value on the next clock pulse.

The clock signal, SCL, is provided by the master. Data is valid to change while the SCL signal is low, and sampled on the rising edge of the clock. Changes on the SDA line while the SCL line is high define special conditions on the bus, explained below.

### 31.4.2 DEFINITION OF I<sup>2</sup>C TERMINOLOGY

There is language and terminology in the description of I<sup>2</sup>C communication that have definitions specific to I<sup>2</sup>C. That word usage is defined below and may be used in the rest of this document without explanation. This table was adapted from the Philips I<sup>2</sup>C specification.

### 31.4.3 SDA AND SCL PINS

Selection of any I<sup>2</sup>C mode with the SSPEN bit set, forces the SCL and SDA pins to be open-drain. These pins should be set by the user to inputs by setting the appropriate TRIS bits.

**Note 1:** Data is tied to output zero when an I<sup>2</sup>C mode is enabled.

**2:** Any device pin can be selected for SDA and SCL functions with the PPS peripheral. These functions are bidirectional. The SDA input is selected with the SSPDATPPS registers. The SCL input is selected with the SSPCLKPPS registers. Outputs are selected with the RxyPPS registers. It is the user's responsibility to make the selections so that both the input and the output for each function is on the same pin.

### 31.4.4 SDA HOLD TIME

The hold time of the SDA pin is selected by the SDAHT bit of the SSPxCON3 register. Hold time is the time SDA is held valid after the falling edge of SCL. Setting the SDAHT bit selects a longer 300 ns minimum hold time and may help on buses with large capacitance.

TABLE 31-1: I<sup>2</sup>C BUS TERMS

TERM	Description
Transmitter	The device which shifts data out onto the bus.
Receiver	The device which shifts data in from the bus.
Master	The device that initiates a transfer, generates clock signals and terminates a transfer.
Slave	The device addressed by the master.
Multi-master	A bus with more than one device that can initiate data transfers.
Arbitration	Procedure to ensure that only one master at a time controls the bus. Winning arbitration ensures that the message is not corrupted.
Synchronization	Procedure to synchronize the clocks of two or more devices on the bus.
Idle	No master is controlling the bus, and both SDA and SCL lines are high.
Active	Any time one or more master devices are controlling the bus.
Addressed Slave	Slave device that has received a matching address and is actively being clocked by a master.
Matching Address	Address byte that is clocked into a slave that matches the value stored in SSPxADD.
Write Request	Slave receives a matching address with R/W bit clear, and is ready to clock in data.
Read Request	Master sends an address byte with the R/W bit set, indicating that it wishes to clock data out of the Slave. This data is the next and all following bytes until a Restart or Stop.
Clock Stretching	When a device on the bus hold SCL low to stall communication.
Bus Collision	Any time the SDA line is sampled low by the module while it is outputting and expected high state.

 1 = SMT acquisition is in progress  
 0 = SMT acquisition is not in progress

# PIC16(L)F18854

## 33.1.2.8 Asynchronous Reception Setup:

1. Initialize the SPBRGH, SPBRGL register pair and the BRGH and BRG16 bits to achieve the desired baud rate (see **Section 33.3 “EUSART Baud Rate Generator (BRG)”**).
2. Clear the ANSEL bit for the RX pin (if applicable).
3. Enable the serial port by setting the SPEN bit. The SYNC bit must be clear for asynchronous operation.
4. If interrupts are desired, set the RCIE bit of the PIE3 register and the GIE and PEIE bits of the INTCON register.
5. If 9-bit reception is desired, set the RX9 bit.
6. Enable reception by setting the CREN bit.
7. The RCIF interrupt flag bit will be set when a character is transferred from the RSR to the receive buffer. An interrupt will be generated if the RCIE interrupt enable bit was also set.
8. Read the RC1STA register to get the error flags and, if 9-bit data reception is enabled, the ninth data bit.
9. Get the received eight Least Significant data bits from the receive buffer by reading the RCREG register.
10. If an overrun occurred, clear the OERR flag by clearing the CREN receiver enable bit.

## 33.1.2.9 9-bit Address Detection Mode Setup

This mode would typically be used in RS-485 systems. To set up an Asynchronous Reception with Address Detect Enable:

1. Initialize the SPBRGH, SPBRGL register pair and the BRGH and BRG16 bits to achieve the desired baud rate (see **Section 33.3 “EUSART Baud Rate Generator (BRG)”**).
2. Clear the ANSEL bit for the RX pin (if applicable).
3. Enable the serial port by setting the SPEN bit. The SYNC bit must be clear for asynchronous operation.
4. If interrupts are desired, set the RCIE bit of the PIE3 register and the GIE and PEIE bits of the INTCON register.
5. Enable 9-bit reception by setting the RX9 bit.
6. Enable address detection by setting the ADDEN bit.
7. Enable reception by setting the CREN bit.
8. The RCIF interrupt flag bit will be set when a character with the ninth bit set is transferred from the RSR to the receive buffer. An interrupt will be generated if the RCIE interrupt enable bit was also set.
9. Read the RC1STA register to get the error flags. The ninth data bit will always be set.
10. Get the received eight Least Significant data bits from the receive buffer by reading the RCREG register. Software determines if this is the device's address.
11. If an overrun occurred, clear the OERR flag by clearing the CREN receiver enable bit.
12. If the device has been addressed, clear the ADDEN bit to allow all received data into the receive buffer and generate interrupts.

## Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
