Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	17
Program Memory Size	1KB (1K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f0131hh020eg

Overview

Zilog's Z8 Encore! MCU family of products are the first in a line of Zilog microcontroller products based on the 8-bit eZ8 CPU. The Z8 Encore! F0830 Series products expand on Zilog's extensive line of 8-bit microcontrollers. The Flash in-circuit programming capability allows for faster development time and program changes in the field. The new eZ8 CPU is upward-compatible with existing Z8 CPU instructions. The rich peripheral set of Z8 Encore! F0830 Series makes it suitable for a variety of applications including motor control, security systems, home appliances, personal electronic devices and sensors.

Features

The key features of Z8 Encore! F0830 Series MCU include:

- 20 MHz eZ8 CPU
- Up to 12 KB Flash memory with in-circuit programming capability
- Up to 256 B register RAM
- 64 B Nonvolatile Data Storage (NVDS)
- Up to 25 I/O pins depending upon package
- Internal Precision Oscillator (IPO)
- External crystal oscillator
- Two enhanced 16-bit timers with capture, compare and PWM capability
- Watchdog Timer (WDT) with dedicated internal RC oscillator
- Single-pin, On-Chip Debugger (OCD)
- Optional 8-channel, 10-bit Analog-to-Digital Converter (ADC)
- On-chip analog comparator
- Up to 17 interrupt sources
- Voltage Brown-Out (VBO) protection
- Power-On Reset (POR)
- 2.7 V to 3.6 V operating voltage
- Up to thirteen 5 V-tolerant input pins
- 20- and 28-pin packages
- 0°C to +70°C standard temperature range and –40°C to +105°C extended temperature operating ranges

Pin Characteristics

Table 5 provides detailed characteristics of each pin available on the Z8 Encore! F0830 Series 20- and 28-pin devices. Data in Table 5 are sorted alphabetically by the pin symbol mnemonic.

Table 5. Pin Characteristics (20- and 28-pin Devices)

Symbol Mnemonic	Direction	Reset Direction	Active Low or Active High	Tristate Output	Internal Pull-Up or Pull-Down	Schmitt-Trigger Input	Open Drain Output	5V Tolerance
AV_{DD}	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
AV_{SS}	N/A	N/A	N/A	N/A	N/A	N/A	N/A	NA
DBG	I/O	I	N/A	Yes	No	Yes	Yes	Yes
PA[7:0]	I/O	I	N/A	Yes	Programmable pull-up	Yes	Yes, Programmable	PA[7:2] only
PB[7:0]	I/O	I	N/A	Yes	Programmable pull-up	Yes	Yes, Programmable	PB[7:6] only
PC[7:0]	I/O	I	N/A	Yes	Programmable pull-up	Yes	Yes, Programmable	PC[7:3] only
RESET/PD0	I/O	I/O (defaults to $\overline{\text{RESET}}$)	Low (in RESET mode)	Yes (PD0 only)	Programmable for PD0; always on for $\overline{\text{RESET}}$	Yes	Programmable for PD0; always on for $\overline{\text{RESET}}$	Yes
V_{DD}	N/A	N/A	N/A	N/A			N/A	N/A
V_{SS}	N/A	N/A	N/A	N/A			N/A	N/A

Note: PB6 and PB7 are available only in devices without an ADC function.

Data Memory

The Z8 Encore! F0830 Series does not use the eZ8 CPU's 64KB data memory address space.

Flash Information Area

Table 7 maps the Z8 Encore! F0830 Series Flash information area. The 128-byte information area is accessed, by setting bit 7 of the Flash Page Select Register to 1. When access is enabled, the Flash information area is mapped into program memory and overlays these 128 bytes at addresses FE00H to FE7FH. When information area access is enabled, all reads from these program memory addresses return information area data rather than program memory data. Access to the Flash information area is read-only.

Table 7. Z8 Encore! F0830 Series Flash Memory Information Area Map

Program Memory Address (Hex)	Function
FE00–FE3F	Zilog option bits
FE40–FE53	Part Number 20-character ASCII alphanumeric code Left-justified and filled with FH
FE54–FE5F	Reserved
FE60–FE7F	Reserved
FE80–FFFF	Reserved

Table 8. Register File Address Map (Continued)

Address (Hex)	Register Description	Mnemonic	Reset (Hex)	Page No.
Trim Bit Control				
FF6	Trim bit address	TRMADR	00	126
FF7	Trim data	TRMDR	XX	127
Flash Memory Controller				
FF8	Flash control	FCTL	00	119
FF8	Flash status	FSTAT	00	120
FF9	Flash page select	FPS	00	121
	Flash sector protect	FPROT	00	122
FFA	Flash programming frequency high byte	FFREQH	00	123
FFB	Flash programming frequency low byte	FFREQL	00	123
eZ8 CPU				
FFC	Flags	—	XX	Refer to the eZ8 CPU Core User Manual (UM0128)
FFD	Register pointer	RP	XX	
FFE	Stack pointer high byte	SPH	XX	
FFF	Stack pointer low byte	SPL	XX	

Note: XX = Undefined.

clock and reset signals, the required reset duration may be three or four clock periods. A reset pulse of three clock cycles in duration might trigger a reset and a reset pulse of four cycles in duration always triggers a reset.

While the $\overline{\text{RESET}}$ input pin is asserted low, the Z8 Encore! F0830 Series devices remain in the Reset state. If the $\overline{\text{RESET}}$ pin is held low beyond the system reset time-out, the device exits the Reset state on the system clock rising edge following $\overline{\text{RESET}}$ pin deassertion. Following a system reset initiated by the external $\overline{\text{RESET}}$ pin, the EXT status bit in the Reset Status (RSTSTAT) Register is set to 1.

External Reset Indicator

During system reset or when enabled by the GPIO logic, the $\overline{\text{RESET}}$ pin functions as an open-drain (active low) RESET mode indicator in addition to the input functionality. This reset output feature allows an Z8 Encore! F0830 Series device to reset other components to which it is connected, even if that reset is caused by internal sources such as POR, VBO or WDT events. See the Port A–D Control Registers section on page 41.

After an internal Reset event occurs, the internal circuitry begins driving the $\overline{\text{RESET}}$ pin low. The $\overline{\text{RESET}}$ pin is held low by the internal circuitry until the appropriate delay listed in Table 9 (see page 22) has elapsed.

On-Chip Debugger Initiated Reset

A Power-On Reset can be initiated using the On-Chip Debugger by setting the RST bit in the OCD Control Register. The OCD block is not reset, but the remainder of the chip goes through a normal system reset. The RST bit automatically clears during the system reset. Following the system reset, the POR bit in the Reset Status (RSTSTAT) Register is set.

Stop Mode Recovery

The device enters the STOP Mode when the STOP instruction is executed by the eZ8 CPU. See the Low-Power Modes chapter on page 30 for detailed STOP Mode information. During Stop Mode Recovery, the CPU is held in reset for about 66 IPO cycles if the crystal oscillator is disabled or about 5000 cycles if it is enabled.

Stop Mode Recovery does not affect the on-chip registers other than the Reset Status (RSTSTAT) Register and the Oscillator Control Register (OSCCTL). After any Stop Mode Recovery, the IPO is enabled and selected as the system clock. If another system clock source is required or IPO disabling is required, the Stop Mode Recovery code must reconfigure the oscillator control block such that the correct system clock source is enabled and selected.

Low-Power Modes

The Z8 Encore! F0830 Series products contain power saving features. The highest level of power reduction is provided by the STOP Mode. The next level of power reduction is provided by the HALT Mode.

Further power savings can be implemented by disabling the individual peripheral blocks while in NORMAL Mode.

The user must not enable the pull-up register bits for unused GPIO pins, since these ports are default output to VSS. Unused GPIOs include those missing on 20-pin packages, as well as those missing on the ADC-enabled 28-pin packages.

STOP Mode

Executing the eZ8 CPU's STOP instruction places the device into STOP Mode. In STOP Mode, the operating characteristics are:

- Primary crystal oscillator and Internal Precision Oscillator are stopped; XIN and XOUT (if previously enabled) are disabled and PA0/PA1 revert to the states programmed by the GPIO registers
- System clock is stopped
- eZ8 CPU is stopped
- Program counter (PC) stops incrementing
- Watchdog Timer's internal RC oscillator continues to operate if enabled by the Oscillator Control Register
- If enabled, the Watchdog Timer logic continues to operate
- If enabled for operation in STOP Mode by the associated Flash option bit, the Voltage Brown-Out protection circuit continues to operate
- All other on-chip peripherals are idle

To minimize the current in STOP Mode, all GPIO pins that are configured as digital inputs must be driven to V_{DD} when the pull-up register bit is enabled or to one of power rail (V_{DD} or GND) when the pull-up register bit is disabled. The device can be brought out of STOP Mode using Stop Mode Recovery. For more information about Stop Mode Recovery, see *the* Reset and Stop Mode Recovery *chapter on page 21*.

Table 16. Port Alternate Function Mapping (Continued)

Port	Pin	Mnemonic	Alternate Function Description	Alternate Function Set Register AFS1
Port B[2]	PB0	Reserved		AFS1[0]: 0
		ANA0	ADC analog input	AFS1[0]: 1
	PB1	Reserved		AFS1[1]: 0
		ANA1	ADC analog input	AFS1[1]: 1
	PB2	Reserved		AFS1[2]: 0
		ANA2	ADC analog input	AFS1[2]: 1
	PB3	CLKIN	External input clock	AFS1[3]: 0
		ANA3	ADC analog input	AFS1[3]: 1
	PB4	Reserved		AFS1[4]: 0
		ANA7	ADC analog input	AFS1[4]: 1
	PB5	Reserved		AFS1[5]: 0
		V_{REF}	ADC reference voltage	AFS1[5]: 1
	PB6	Reserved		AFS1[6]: 0
		Reserved		AFS1[6]: 1
	PB7	Reserved		AFS1[7]: 0
		Reserved		AFS1[7]: 1

Notes:
1. Because there is only a single alternate function for each Port A and Port D (PD0) pin, the Alternate Function Set registers are not implemented for Port A and Port D (PD0). Enabling alternate function selections (as described in the Port A–D Alternate Function Subregisters section on page 42) automatically enables the associated alternate function.
2. Because there are at most two choices of alternate functions for any Port B pin, the AFS2 Alternate Function Set Register is implemented but is not used to select the function. Additionally, alternate function selection (as described in the Port A–D Alternate Function Subregisters section on page 42) must also be enabled.
3. Because there are at most two choices of alternate functions for any Port C pin, the AFS2 Alternate Function Set Register is implemented but is not used to select the function. Additionally, alternate function selection (as described in the Port A–D Alternate Function Subregisters section on page 42) must also be enabled.

Port A–D Pull-up Enable Subregisters

The Port A–D Pull-Up Enable Subregister is accessed through the Port A–D Control Register by writing 06H to the Port A–D Address Register. See Table 26. Setting the bits in the Port A–D Pull-Up Enable subregisters enables a weak internal resistive pull-up on the specified port pins.

Table 26. Port A–D Pull-Up Enable Subregisters (PxPUE)

Bit	7	6	5	4	3	2	1	0
Field	PPUE7	PPUE6	PPUE5	PPUE4	PPUE3	PPUE2	PPUE1	PPUE0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 06H in Port A–D Address Register, accessible through the Port A–D Control Register							

Bit	Description
[7:0] P*x*PUE	**Port Pull-Up Enable** 0 = The weak pull-up on the port pin is disabled. 1 = The weak pull-up on the port pin is enabled.

Note: x indicates the specific GPIO port pin number (7–0).

Port A–D Output Data Register

The Port A–D Output Data Register, shown in Table 30, controls the output data to the pins.

Table 30. Port A–D Output Data Register (P*x*OUT)

Bit	7	6	5	4	3	2	1	0
Field	POUT7	POUT6	POUT5	POUT4	POUT3	POUT2	POUT1	POUT0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FD3H, FD7H, FDBH, FDFH							

Bit	Description
[7:0] PxOUT	**Port Output Data** These bits contain the data to be driven to the port pins. The values are only driven if the corresponding pin is configured as an output and the pin is not configured for Alternate function operation. 0 = Drive a logical 0 (Low). 1= Drive a logical 1 (High). High value is not driven if the drain has been disabled by setting the corresponding port output Control Register bit to 1.

Note: x indicates the specific GPIO port pin number (7–0).

Interrupt Controller

The Interrupt Controller on the Z8 Encore!® F0830 Series products prioritize the interrupt requests from the on-chip peripherals and the GPIO port pins. The features of the Interrupt Controller include:

- Seventeen interrupt sources using sixteen unique interrupt vectors:
  - Twelve GPIO port pin interrupt sources
  - Five on-chip peripheral interrupt sources (Comparator Output interrupt shares one interrupt vector with PA6)
- Flexible GPIO interrupts
  - Eight selectable rising and falling edge GPIO interrupts
  - Four dual-edge interrupts
- Three levels of individually programmable interrupt priority
- Watchdog Timer can be configured to generate an interrupt
  m

Interrupt requests (IRQs) allow peripheral devices to suspend CPU operation in an orderly manner and force the CPU to start an interrupt service routine (ISR). Usually this interrupt service routine is involved with the exchange of data, status information or control information between the CPU and the interrupting peripheral. When the service routine is completed, the CPU returns to the operation from which it was interrupted.

The eZ8 CPU supports both vectored and polled interrupt handling. For polled interrupts, the Interrupt Controller has no effect on operation. For more information about interrupt servicing by the eZ8 CPU, refer to the eZ8 CPU User Manual (UM0128), which is available for download at www.zilog.com.

Interrupt Vector Listing

Table 34 lists the interrupts available in order of priority. The interrupt vector is stored with the most significant byte (MSB) at the even program memory address and the least significant byte (LSB) at the odd program memory address.

Note: Some port interrupts are not available on the 20-pin and 28-pin packages. The ADC interrupt is unavailable on devices not containing an ADC.

Interrupt Request 2 Register

The Interrupt Request 2 (IRQ2) Register, shown in Table 37, stores interrupt requests for both vectored and polled interrupts. When a request is sent to the Interrupt Controller, the corresponding bit in the IRQ2 Register becomes 1. If interrupts are globally enabled (vectored interrupts), the Interrupt Controller passes an interrupt request to the eZ8 CPU. If interrupts are globally disabled (polled interrupts), the eZ8 CPU can read the Interrupt Request 2 Register to determine if any interrupt requests are pending.

Table 37. Interrupt Request 2 Register (IRQ2)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				PC3I	PC2I	PC1I	PC0I
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FC6H							

Bit	Description
[7:4]	**Reserved** These registers are reserved and must be programmed to 0000.
[3] PC*x*I	**Port C Pin *x* Interrupt Request** 0 = No interrupt request is pending for GPIO Port C pin *x*. 1 = An interrupt request from GPIO Port C pin *x* is awaiting service.

Note: x indicates the specific GPIO port pin number (3–0).

IRQ0 Enable High and Low Bit Registers

Table 38 lists the priority control values for IRQ0. The IRQ0 Enable High and Low Bit registers, shown in Tables 39 and 40, form a priority-encoded enabling service for interrupts in the Interrupt Request 0 Register. Priority is generated by setting the bits in each register.

Table 38. IRQ0 Enable and Priority Encoding

IRQ0ENH[*x*]	IRQ0ENL[*x*]	Priority	Description
0	0	Disabled	Disabled
0	1	Level 1	Low
1	0	Level 2	Nominal
1	1	Level 3	High

Note: *x* indicates the register bits in the range 7–0.

is enabled, the timer output pin changes state (from Low to High or from High to Low) at timer reload.

Observe the following steps for configuring a timer for COUNTER Mode and for initiating the count:

1. Write to the Timer Control Register to:
   - Disable the timer
   - Configure the timer for COUNTER Mode
   - Select either the rising edge or falling edge of the timer input signal for the count. This selection also sets the initial logic level (High or Low) for the timer output alternate function. However, the timer output function is not required to be enabled.
2. Write to the Timer High and Low Byte registers to set the starting count value. This only affects the first pass in COUNTER Mode. After the first timer reload in COUNTER Mode, counting always begins at the reset value `0001H`. In COUNTER Mode, the Timer High and Low Byte registers must be written with the value `0001H`.
3. Write to the Timer Reload High and Low Byte registers to set the reload value.
4. If appropriate, enable the timer interrupt and set the timer interrupt priority by writing to the relevant interrupt registers.
5. Configure the associated GPIO port pin for the timer input alternate function.
6. If using the timer output function, configure the associated GPIO port pin for the timer output alternate function.
7. Write to the Timer Control Register to enable the timer.

In COUNTER Mode, the number of timer input transitions is calculated with the following equation:

Counter Mode Timer Input Transitions = Current Count Value – Start Value

COMPARATOR COUNTER Mode

In COMPARATOR COUNTER Mode, the timer counts the input transitions from the analog comparator output. The TPOL bit in the Timer Control Register determines whether the count occurs on the rising edge or the falling edge of the comparator output signal. In COMPARATOR COUNTER Mode, the prescaler is disabled.

Timer 0–1 PWM High and Low Byte Registers

The Timer 0–1 PWM High and Low Byte (TxPWMH and TxPWML) registers, shown in Tables 54 and 55, control PWM operations. These registers also store the capture values for the CAPTURE and CAPTURE/COMPARE modes.

Table 54. Timer 0–1 PWM High Byte Register (TxPWMH)

Bit	7	6	5	4	3	2	1	0
Field	PWMH							
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F04H, F0CH							

Table 55. Timer 0–1 PWM Low Byte Register (TxPWML)

Bit	7	6	5	4	3	2	1	0
Field	PWML							
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F05H, F0DH							

Bit	Description
[7:0] PWMH, PWML	**Pulse Width Modulator High and Low Bytes** These two bytes, {PWMH[7:0], PWML[7:0]}, form a 16-bit value that is compared to the current 16-bit timer count. When a match occurs, the PWM output changes state. The PWM output value is set by the TPOL bit in the Timer Control Register (TxCTL1). The TxPWMH and TxPWML registers also store the 16-bit captured timer value when operating in capture or CAPTURE/COMPARE modes.

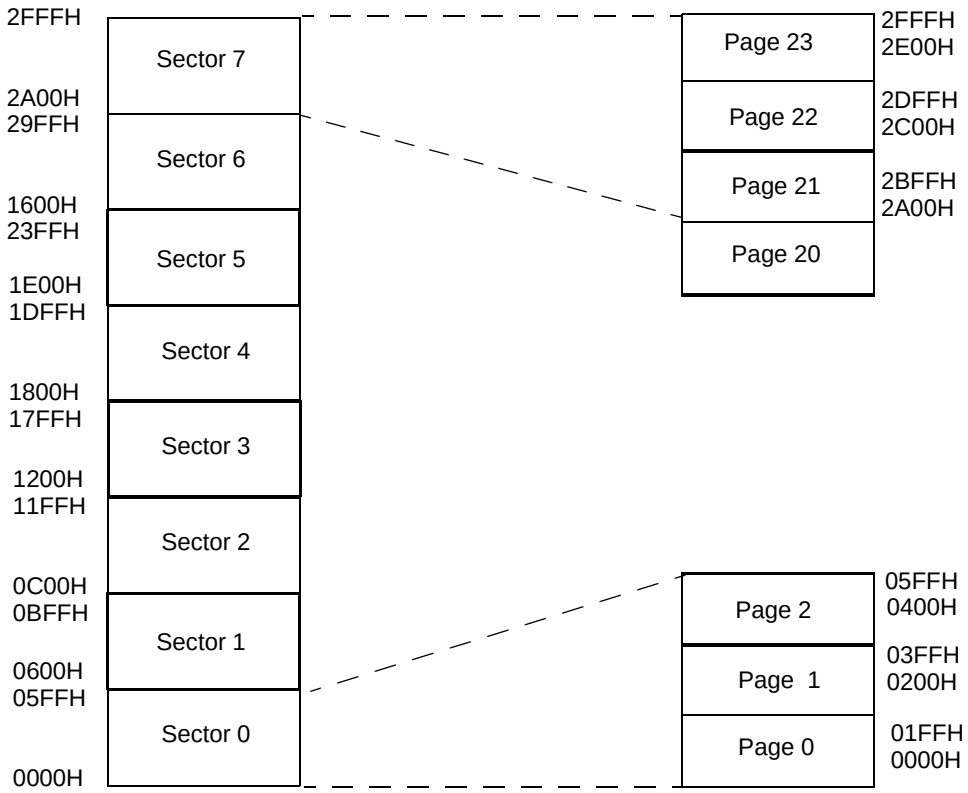

Figure 18. 12K Flash without NVDS

Data Memory Address Space

The Flash information area, including Zilog Flash option bits, are located in the data memory address space. The Z8 Encore! MCU is configured by these proprietary Flash option bits to prevent the user from writing to the eZ8 CPU data memory address space.

Flash Information Area

The Flash information area is physically separate from program memory and is mapped to the address range FE00H to FE7FH. Not all of these addresses are user-accessible. Factory trim values for the VBO, Internal Precision Oscillator and factory calibration data for the ADC are stored here.

Table 70 describes the Flash information area. This 128-byte information area is accessed by setting the bit 7 of the Flash Page Select Register to 1. When access is enabled, the

Note: The bit values used in Table 85 are set at the factory; no calibration is required.

Table 86. Trim Option Bits at 0002H (TIPO)

Bit	7	6	5	4	3	2	1	0
Field	IPO_TRIM							
RESET	U							
R/W	R/W							
Address	Information Page Memory 0022H							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7:0] IPO_TRIM	**Internal Precision Oscillator Trim Byte** Contains trimming bits for the Internal Precision Oscillator.

Note: The bit values used in Table 86 are set at the factory; no calibration is required.

Table 87. Trim Option Bits at 0003H (TVBO)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				Reserved	VBO_TRIM		
RESET	U				U	1	0	0
R/W	R/W				R/W	R/W		
Address	Information Page Memory 0023H							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7:3]	**Reserved** These bits are reserved and must be programmed to 11111.
[2] VBO_TRIM	**VBO Trim Values** Contains factory-trimmed values for the oscillator and the VBO.

Table 113. eZ8 CPU Instruction Summary (Continued)
