
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	23
Program Memory Size	2KB (2K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f0230qj020sg

Warning: DO NOT USE THIS PRODUCT IN LIFE SUPPORT SYSTEMS.

LIFE SUPPORT POLICY

ZILOG'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF ZILOG CORPORATION.

As used herein

Life support devices or systems are devices which (a) are intended for surgical implant into the body or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.

Document Disclaimer

 Information in this publication concerning the devices, applications or technology described is intended to suggest possible uses and may be superseded. ZILOG, INC. DOES NOT ASSUME LIABILITY FOR OR PROVIDE A REPRESENTATION OF ACCURACY OF THE INFORMATION, DEVICES or TECHNOLOGY DESCRIBED IN THIS DOCUMENT. ZILOG ALSO DOES NOT ASSUME LIABILITY FOR INTELLECTUAL PROPERTY INFRINGEMENT RELATED IN ANY MANNER TO USE OF INFORMATION, DEVICES or TECHNOLOGY DESCRIBED HEREIN OR OTHERWISE. The information contained within this document has been verified according to the general principles of electrical and mechanical engineering.

Overview

Zilog's Z8 Encore! MCU family of products are the first in a line of Zilog microcontroller products based on the 8-bit eZ8 CPU. The Z8 Encore! F0830 Series products expand on Zilog's extensive line of 8-bit microcontrollers. The Flash in-circuit programming capability allows for faster development time and program changes in the field. The new eZ8 CPU is upward-compatible with existing Z8 CPU instructions. The rich peripheral set of Z8 Encore! F0830 Series makes it suitable for a variety of applications including motor control, security systems, home appliances, personal electronic devices and sensors.

Features

The key features of Z8 Encore! F0830 Series MCU include:

- 20 MHz eZ8 CPU
- Up to 12 KB Flash memory with in-circuit programming capability
- Up to 256 B register RAM
- 64 B Nonvolatile Data Storage (NVDS)
- Up to 25 I/O pins depending upon package
- Internal Precision Oscillator (IPO)
- External crystal oscillator
- Two enhanced 16-bit timers with capture, compare and PWM capability
- Watchdog Timer (WDT) with dedicated internal RC oscillator
- Single-pin, On-Chip Debugger (OCD)
- Optional 8-channel, 10-bit Analog-to-Digital Converter (ADC)
- On-chip analog comparator
- Up to 17 interrupt sources
- Voltage Brown-Out (VBO) protection
- Power-On Reset (POR)
- 2.7 V to 3.6 V operating voltage
- Up to thirteen 5 V-tolerant input pins
- 20- and 28-pin packages
- 0°C to +70°C standard temperature range and –40°C to +105°C extended temperature operating ranges

Block Diagram

Figure 1 displays a block diagram of the Z8 Encore! F0830 Series architecture.

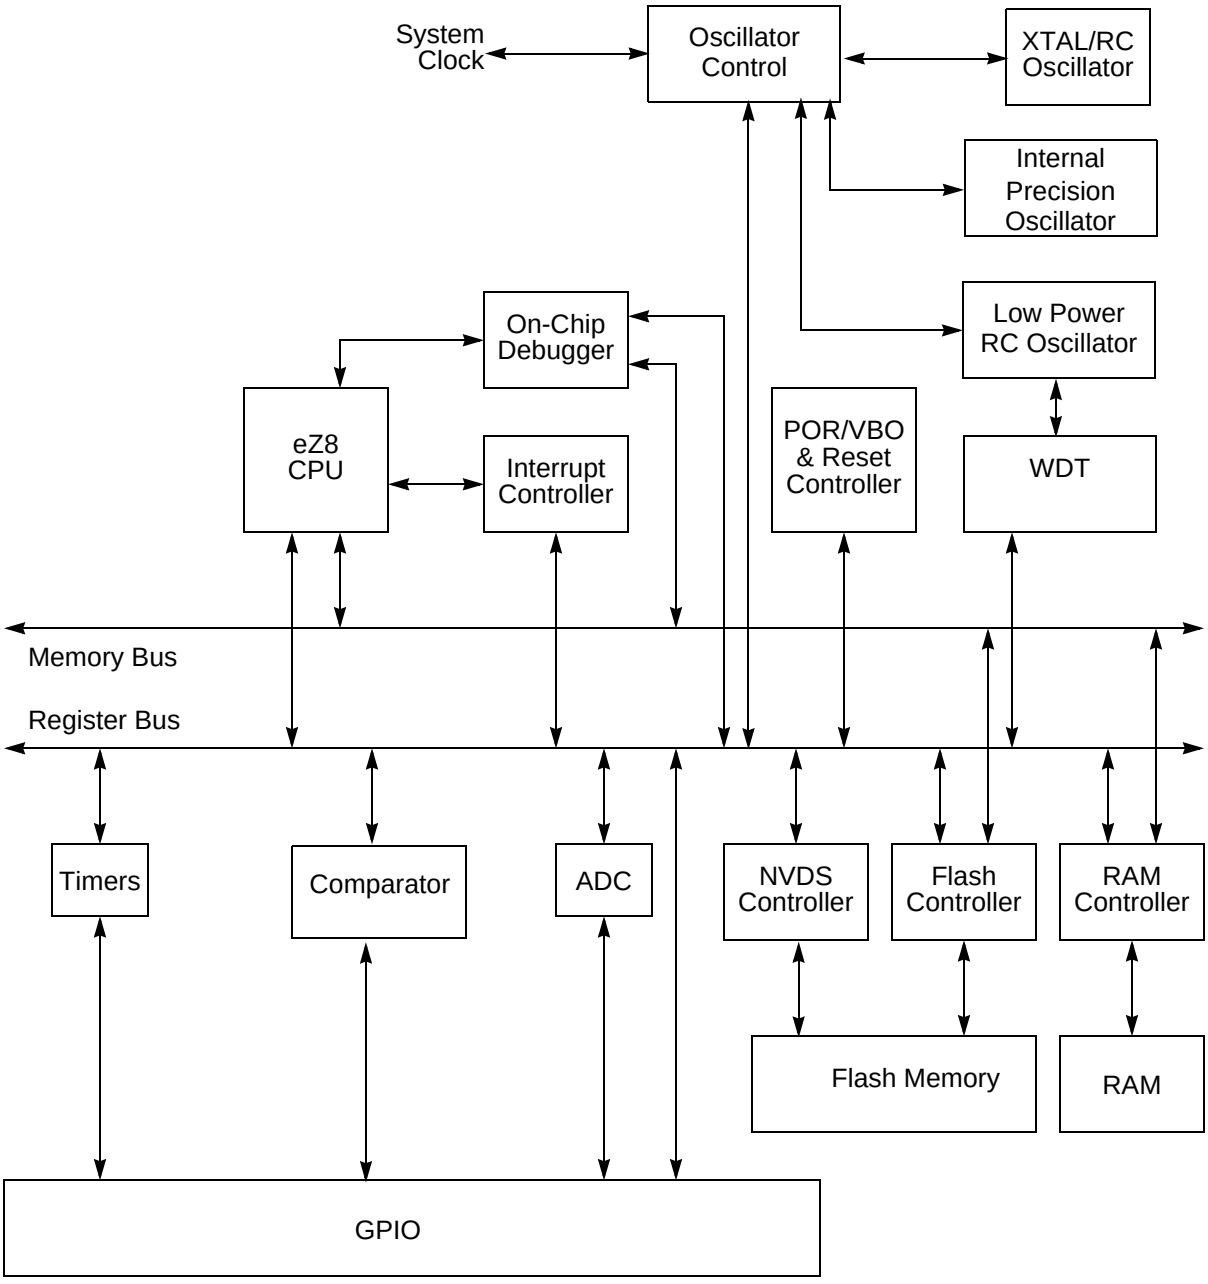

Figure 1. Z8 Encore! F0830 Series Block Diagram

Architecture

Figure 8 displays a simplified block diagram of a GPIO port pin. In this figure, the ability to accommodate alternate functions and variable port current drive strength is not displayed.

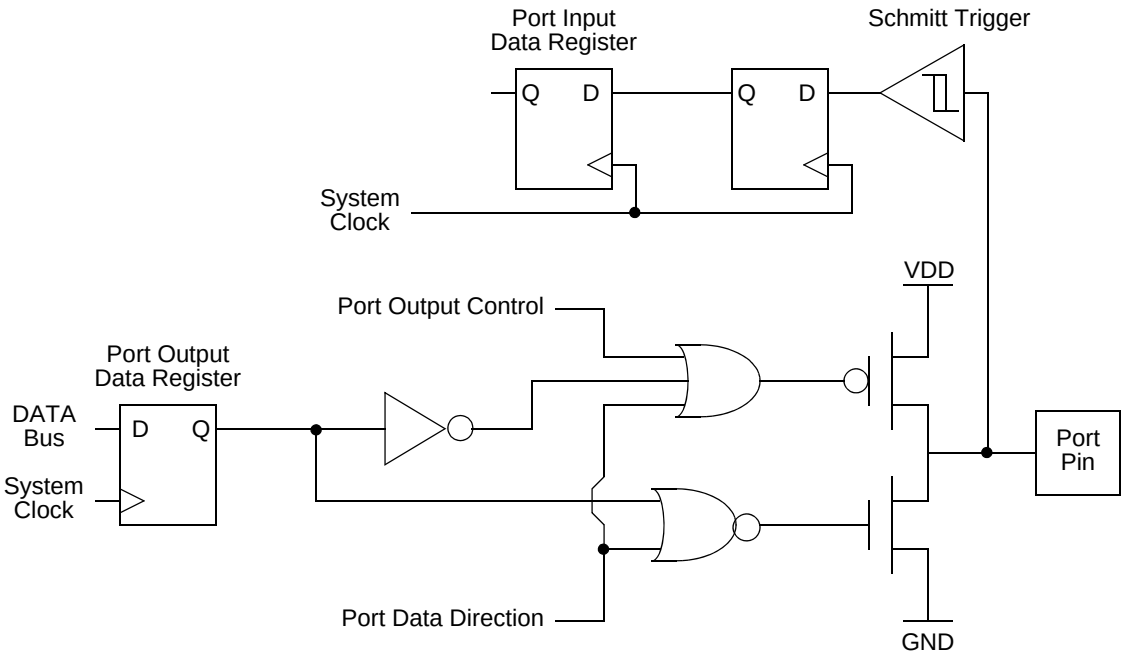

Figure 8. GPIO Port Pin Block Diagram

GPIO Alternate Functions

Many of the GPIO port pins can be used for general purpose input/output and access to on-chip peripheral functions such as the timers and serial communication devices. The Port A–D Alternate Function subregisters configure these pins for either GPIO or Alternate function operation. When a pin is configured for Alternate function, control of the port pin direction (input/output) is passed from the Port A–D data direction registers to the Alternate function assigned to this pin. Table 16 on page 36 lists the alternate functions possible with each port pin. The alternate function associated at a pin is defined through Alternate Function subregisters AFS1 and AFS2.

The crystal oscillator functionality is not controlled by the GPIO block. When the crystal oscillator is enabled in the oscillator control block, the GPIO functionality of PA0 and PA1 is overridden. In that case, pins PA0 and PA1 functions as input and output for the crystal oscillator.

Port A–D Output Control Subregisters

The Port A–D Output Control Subregister, shown in Table 23, is accessed through the Port A–D Control Register by writing 03H to the Port A–D Address Register. Setting the bits in the Port A–D Output Control subregisters to 1 configures the specified port pins for open-drain operation. These subregisters affect the pins directly and, as a result, alternate functions are also affected.

Table 23. Port A–D Output Control Subregisters (PxOC)

Bit	7	6	5	4	3	2	1	0
Field	POC7	POC6	POC5	POC4	POC3	POC2	POC1	POC0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 03H in Port A–D Address Register, accessible through the Port A–D Control Register							

Bit	Description
[7:0] POCx	**Port Output Control** These bits function independently of the Alternate function bit and always disable the drains, if set to 1. 0 = The drains are enabled for any OUTPUT Mode (unless overridden by the Alternate function). 1 = The drain of the associated pin is disabled (OPEN-DRAIN mode).

Note: x indicates the specific GPIO port pin number (7–0).

Port A–D Alternate Function Set 1 Subregisters

The Port A–D Alternate Function Set 1 Subregister, shown in Table 27, is accessed through the Port A–D Control Register by writing 07H to the Port A–D Address Register. The Alternate Function Set 1 subregisters select the alternate function available at a port pin. Alternate functions selected by setting or clearing bits in this register are defined in the GPIO Alternate Functions section on page 34.

Note: Alternate function selection on the port pins must also be enabled, as described in the Port A–D Alternate Function Subregisters section on page 42.

Table 27. Port A–D Alternate Function Set 1 Subregisters (PxAFS1)

Bit	7	6	5	4	3	2	1	0
Field	PAFS17	PAFS16	PAFS15	PAFS14	PAFS13	PAFS12	PAFS11	PAFS10
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 07H in Port A–D Address Register, accessible through the Port A–D Control Register							

Bit	Description
[7:0] PAFS1x	**Port Alternate Function Set 1** 0 = Port Alternate function selected as defined in Table 16 in GPIO Alternate Functions section. 1 = Port Alternate function selected as defined in Table 16 in GPIO Alternate Functions section.

Note: x indicates the specific GPIO port pin number (7–0).

Interrupt Control Register

The Interrupt Control (IRQCTL) Register, shown in Table 49, contains the master enable bit for all interrupts.

Table 49. Interrupt Control Register (IRQCTL)

Bit	7	6	5	4	3	2	1	0
Field	IRQE	Reserved						
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R
Address	FCFH							

Bit	Description
[7] IRQE	**Interrupt Request Enable** This bit is set to 1 by executing an Enable Interrupts (EI) or Interrupt Return (IRET) instruction or by a direct register write of 1 to this bit. It is reset to 0 by executing a `DI` instruction, eZ8 CPU acknowledgement of an interrupt request, reset, or by a direct register write of a 0 to this bit. 0 = Interrupts are disabled. 1 = Interrupts are enabled.
[6:0]	**Reserved** These registers are reserved and must be programmed to 0000000.

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{Reload Value} - \text{PWM Value}}{\text{Reload Value}} \times 100$$

If TPOL is set to 1, the ratio of the PWM output high time to the total period is represented by:

$$\text{PWM Output High Time Ratio (\%)} = \frac{\text{PWM Value}}{\text{Reload Value}} \times 100$$

CAPTURE Mode

In CAPTURE Mode, the current timer count value is recorded when the appropriate external timer input transition occurs. The capture count value is written to the timer PWM High and Low Byte registers. The timer input is the system clock. The TPOL bit in the Timer Control Register determines if the capture occurs on a rising edge or a falling edge of the timer input signal.

When the capture event occurs, an interrupt is generated and the timer continues counting. The INPCAP bit in the TxCTL1 Register is set to indicate the timer interrupt because of an input capture event.

The timer continues counting up to the 16-bit reload value stored in the Timer Reload High and Low Byte registers. Upon reaching the reload value, the timer generates an interrupt and continues counting. The INPCAP bit in the TxCTL1 Register clears, indicating that the timer interrupt has not occurred because of an input capture event.

Observe the following steps for configuring a timer for CAPTURE Mode and initiating the count:

1. Write to the Timer Control Register to:
   - Disable the timer
   - Configure the timer for CAPTURE Mode
   - Set the prescale value
   - Set the capture edge (rising or falling) for the timer input
2. Write to the Timer High and Low Byte registers to set the starting count value (typically 0001H).
3. Write to the Timer Reload High and Low Byte registers to set the reload value.
4. Clear the timer PWM High and Low Byte registers to 0000H. Clearing these registers allows user software to determine if interrupts were generated either by a capture event or by a reload. If the PWM High and Low Byte registers still contain 0000H after the interrupt, the interrupt were generated by a reload.

Analog-to-Digital Converter

The Z8 Encore! MCU includes an eight-channel Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC). The ADC converts an analog input signal to a 10-bit binary number. The features of the SAR ADC include:

- Eight analog input sources multiplexed with general purpose I/O ports
- Fast conversion time, less than 11.9 µs
- Programmable timing controls
- Interrupt on conversion complete
- Internal voltage reference generator
- Ability to select external reference voltage
- When configuring an ADC using external V_{REF}, PB5 is used as V_{REF} in the 28-pin package

Architecture

The ADC architecture, displayed in Figure 11, consists of an 8-input multiplexer, sample-and-hold amplifier and 10-bit SAR ADC. The ADC digitizes the signal on a selected channel and stores the digitized data in the ADC data registers. In an environment with high electrical noise, an external RC filter must be added at the input pins to reduce high-frequency noise.

$T_{CONV} = T_{S/H} + T_{CON}$

$T_{CONV} = T_S + T_H + 13 * SCLK * 16$

where:

SCLK = System Clock

T_{CONV} = Total conversion time

T_S = Sample time (SCLK * ADCST)

T_{CON} = Conversion time (13 * SCLK * 16)

T_H = Hold time (SCLK * ADCSST)

DIV = 16 (fixed to divide by 16 for F0830 Series products)

Example: For an F0830 Series MCU running @ 20 MHz:

$T_{CONV} = 1\mu s + 0.5\mu s + 13 * SCLK * DIV$

$T_{CONV} = 1\,\mu s + 0.5\,\mu s + 13 * (1/20\,MHz) * 16 = 11.9\,\mu s$

Flash Status Register

The Flash Status Register indicates the current state of the Flash Controller. This register can be read at any time. The read-only Flash Status Register shares its register file address with the write-only Flash Control Register.

Table 73. Flash Status Register (FSTAT)

Bit	7	6	5	4	3	2	1	0
Field	Reserved		FSTAT					
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R
Address	FF8H							

Bit	Description
[7:6]	**Reserved** These bits are reserved and must be programmed to 00.
[5:0] FSTAT	**Flash Controller Status** 000000 = Flash Controller locked. 000001 = First unlock command received (73H written). 000010 = Second unlock command received (8CH written). 000011 = Flash Controller unlocked. 000100 = Sector protect register selected. 001xxx = Program operation in progress. 010xxx = Page Erase operation in progress. 100xxx = Mass Erase operation in progress.

Note: The bit values used in Table 85 are set at the factory; no calibration is required.

Table 86. Trim Option Bits at 0002H (TIPO)

Bit	7	6	5	4	3	2	1	0
Field	IPO_TRIM							
RESET	U							
R/W	R/W							
Address	Information Page Memory 0022H							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7:0] IPO_TRIM	**Internal Precision Oscillator Trim Byte** Contains trimming bits for the Internal Precision Oscillator.

Note: The bit values used in Table 86 are set at the factory; no calibration is required.

Table 87. Trim Option Bits at 0003H (TVBO)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				Reserved	VBO_TRIM		
RESET	U				U	1	0	0
R/W	R/W				R/W	R/W		
Address	Information Page Memory 0023H							

Note: U = Unchanged by Reset. R/W = Read/Write.

Bit	Description
[7:3]	**Reserved** These bits are reserved and must be programmed to 11111.
[2] VBO_TRIM	**VBO Trim Values** Contains factory-trimmed values for the oscillator and the VBO.

On-Chip Debugger

The Z8 Encore! devices contain an integrated On-Chip Debugger (OCD) that provides the following advanced debugging features:

- Reading and writing of the register file
- Reading and writing of program and data memory
- Setting of breakpoints and watchpoints
- Executing eZ8 CPU instructions

Architecture

The On-Chip Debugger consists of four primary functional blocks: transmitter, receiver, autobaud detector/generator and debug controller. Figure 20 displays the architecture of the On-Chip Debugger.

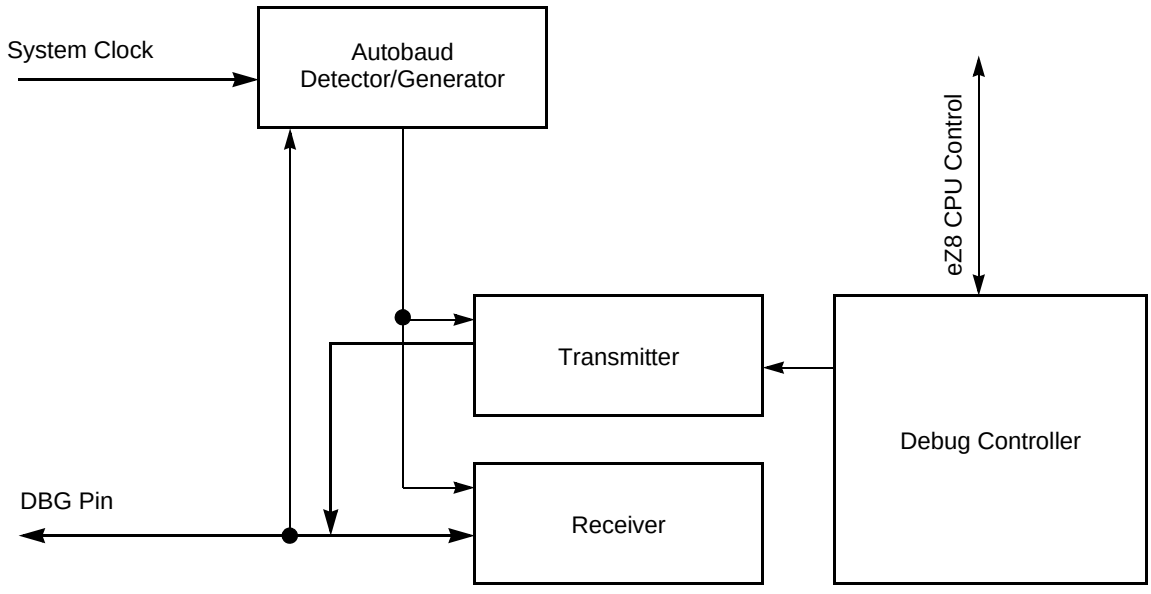

Figure 20. On-Chip Debugger Block Diagram

OCD Status Register

The OCD Status Register reports status information about the current state of the debugger and the system.

Table 97. OCD Status Register (OCDSTAT)

Bit	7	6	5	4	3	2	1	0
Field	DBG	HALT	FRPENB	Reserved				
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Description
[7] DBG	**Debug Status** 0 = NORMAL Mode. 1 = DEBUG Mode.
[6] HALT	**HALT Mode** 0 = Not in HALT Mode. 1 = In HALT Mode.
[5] FRPENB	**Flash Read Protect Option Bit Enable** 0 = FRP bit enabled, that allows disabling of many OCD commands. 1 = FRP bit has no effect.
[4:0]	**Reserved** These bits are reserved and must be programmed to 00000.

General Purpose I/O Port Output Timing

Figure 34 and Table 125 provide timing information for the GPIO port pins.

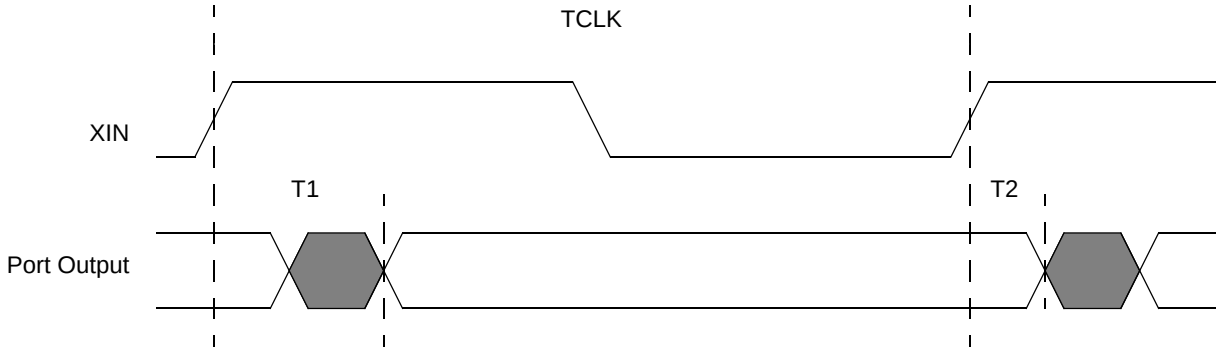

Figure 34. GPIO Port Output Timing

Table 125. GPIO Port Output Timing

		Delay (ns)	
Parameter	**Abbreviation**	**Minimum**	**Maximum**
GPIO Port Pins			
T_1	XIN Rise to Port Output Valid Delay	–	15
T_2	XIN Rise to Port Output Hold Time	2	–
