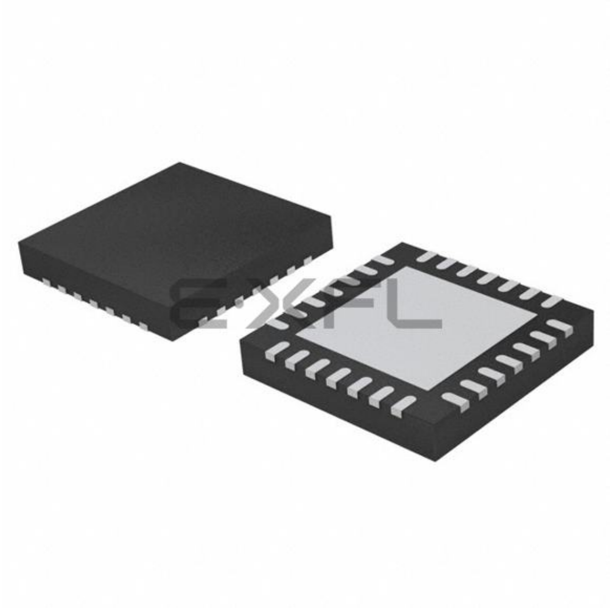
Zilog - Z8F1233QJ020SG Datasheet



What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	eZ8
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	25
Program Memory Size	12KB (12K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f1233qj020sg

CPU and Peripheral Overview

The eZ8 CPU, Zilog's latest 8-bit CPU, meets the continuing demand for faster and more code-efficient microcontrollers. The eZ8 CPU executes a superset of the original Z8 instruction set. The eZ8 CPU features include:

- Direct register-to-register architecture allows each register to function as an accumulator, improving execution time and decreasing the required program memory
- Software stack allows much greater depth in subroutine calls and interrupts than hardware stacks
- Compatible with existing Z8 CPU code
- Expanded internal register file allows access up to 4KB
- New instructions improve execution efficiency for code developed using high-level programming languages, including C
- Pipelined instruction fetch and execution
- New instructions for improved performance including BIT, BSWAP, BTJ, CPC, LDC, LDCI, LEA, MULT and SRL
- New instructions support 12-bit linear addressing of the register file
- Up to 10 MIPS operation
- C Compiler-friendly
- 2 to 9 clock cycles per instruction

For more information about the eZ8 CPU, refer to the eZ8 CPU Core User Manual (UM0128), which is available for download on www.zilog.com.

General Purpose Input/Output

The Z8 Encore! F0830 Series features up to 25 port pins (Ports A–D) for general-purpose input/output (GPIO). The number of GPIO pins available is a function of package. Each pin is individually programmable.

Flash Controller

The Flash Controller programs and erases the Flash memory. It also supports protection against accidental programming and erasure.

Reset Sources

Table 10 lists the possible sources of a system reset.

Table 10. Reset Sources and Resulting Reset Type

Operating Mode	Reset Source	Special Conditions
NORMAL or HALT modes	Power-On Reset/Voltage Brown-Out	Reset delay begins after supply voltage exceeds POR level.
	Watchdog Timer time-out when configured for reset	None.
	$\overline{\text{RESET}}$ pin assertion	All reset pulses less than four system clocks in width are ignored.
	On-Chip Debugger initiated reset (OCDCTL[0] set to 1)	System, except the On-Chip Debugger is unaffected by the reset.
STOP Mode	Power-On Reset/Voltage Brown-Out	Reset delay begins after supply voltage exceeds POR level.
	$\overline{\text{RESET}}$ pin assertion	All reset pulses less than 12 ns are ignored.
	DBG pin driven Low	None.

Power-On Reset

Each device in the Z8 Encore! F0830 Series contains an internal Power-On Reset circuit. The POR circuit monitors the digital supply voltage and holds the device in the Reset state until the digital supply voltage reaches a safe operating level. After the supply voltage exceeds the POR voltage threshold (V_{POR}), the device is held in the Reset state until the POR counter has timed out. If the crystal oscillator is enabled by the option bits, the time-out is longer.

After the Z8 Encore! F0830 Series device exits the Power-On Reset state, the eZ8 CPU fetches the reset vector. Following the Power-On Reset, the POR status bit in the Reset Status (RSTSTAT) Register is set to 1.

Figure 6 displays the Power-On Reset operation. See the Electrical Characteristics chapter on page 184 for the POR threshold voltage (V_{POR}).

The Voltage Brown-Out circuit can be either enabled or disabled during STOP Mode. Operations during STOP Mode is set by the VBO_AO Flash option bit. See the Flash Option Bits chapter on page 124 for information about configuring VBO_AO.

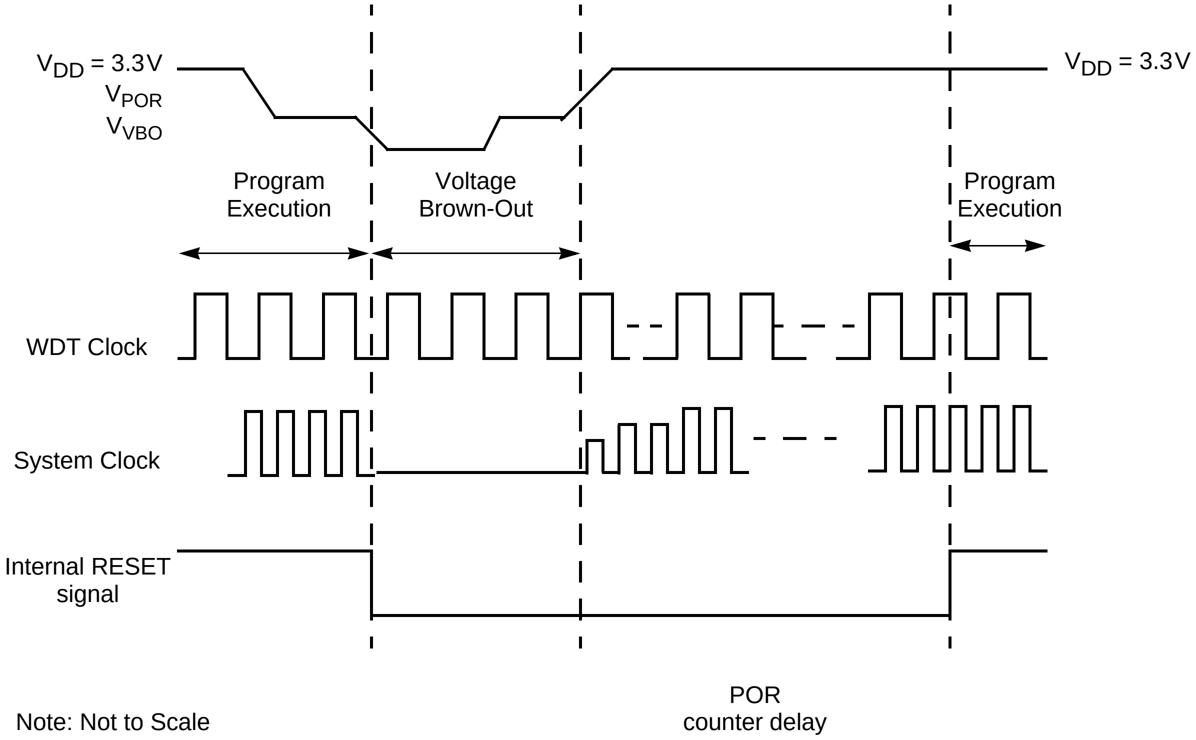


Figure 7. Voltage Brown-Out Reset Operation

Watchdog Timer Reset

If the device is operating in NORMAL or STOP Mode, the Watchdog Timer can initiate a system reset at time-out if the WDT_RES Flash option bit is programmed to 1; this state is the unprogrammed state of the WDT_RES Flash option bit. If the bit is programmed to 0, it configures the Watchdog Timer to cause an interrupt – not a system reset – at time-out. The WDT status bit in the Reset Status (RSTSTAT) Register is set to 1 to signify that the reset was initiated by the Watchdog Timer.

External Reset Input

The $\overline{\text{RESET}}$ pin has a Schmitt-triggered input and an internal pull-up resistor. After the $\overline{\text{RESET}}$ pin is asserted for a minimum of four system clock cycles, the device progresses through the system reset sequence. Because of the possible asynchronicity of the system

Interrupt Request 2 Register

The Interrupt Request 2 (IRQ2) Register, shown in Table 37, stores interrupt requests for both vectored and polled interrupts. When a request is sent to the Interrupt Controller, the corresponding bit in the IRQ2 Register becomes 1. If interrupts are globally enabled (vectored interrupts), the Interrupt Controller passes an interrupt request to the eZ8 CPU. If interrupts are globally disabled (polled interrupts), the eZ8 CPU can read the Interrupt Request 2 Register to determine if any interrupt requests are pending.

Table 37. Interrupt Request 2 Register (IRQ2)

Bit	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Field	Reserved				PC3I	PC2I	PC1I	PC0I
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FC6H							

Bit	**Description**
[7:4]	**Reserved** These registers are reserved and must be programmed to 0000.
[3] PC*x*I	**Port C Pin *x* Interrupt Request** 0 = No interrupt request is pending for GPIO Port C pin *x*. 1 = An interrupt request from GPIO Port C pin *x* is awaiting service.
Note: x indicates the specific GPIO port pin number (3–0).	

IRQ0 Enable High and Low Bit Registers

Table 38 lists the priority control values for IRQ0. The IRQ0 Enable High and Low Bit registers, shown in Tables 39 and 40, form a priority-encoded enabling service for interrupts in the Interrupt Request 0 Register. Priority is generated by setting the bits in each register.

Table 38. IRQ0 Enable and Priority Encoding

IRQ0ENH[*x*]	**IRQ0ENL[*x*]**	**Priority**	**Description**
0	0	Disabled	Disabled
0	1	Level 1	Low
1	0	Level 2	Nominal
1	1	Level 3	High
Note: *x* indicates the register bits in the range 7–0.			

Timer Reload High and Low Byte Registers

The Timer 0–1 Reload High and Low Byte (TxRH and TxRL) registers, shown in Tables 52 and 53, store a 16-bit reload value, {TRH[7:0], TRL[7:0]}. Values written to the Timer Reload High Byte Register are stored in a temporary holding register. When a write to the Timer Reload Low Byte Register occurs, the temporary holding register value is written to the Timer High Byte Register. This operation allows simultaneous updates of the 16-bit timer reload value. In COMPARE Mode, the Timer Reload High and Low Byte registers store the 16-bit compare value.

Table 52. Timer 0–1 Reload High Byte Register (TxRH)

Bit	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Field	TRH							
RESET	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F02H, F0AH							

Table 53. Timer 0–1 Reload Low Byte Register (TxRL)

Bit	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Field	TRL							
RESET	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F03H, F0BH							

Bit	**Description**
[7:0] TRH, TRL	**Timer Reload Register High and Low** These two bytes form the 16-bit reload value, {TRH[7:0], TRL[7:0]}. This value sets the maximum count value, which initiates a timer reload to `0001H`. In COMPARE Mode, these two bytes form the 16-bit compare value.

Bit	Description (Continued)
[2:0] TMODE	**Timer Mode** This field along with the TMODEHI bit in TxCTL0 register determines the operating mode of the timer. TMODEHI is the most significant bit of the timer mode selection value. 0000 = ONE-SHOT Mode. 0001 = CONTINUOUS Mode. 0010 = COUNTER Mode. 0011 = PWM SINGLE OUTPUT Mode. 0100 = CAPTURE Mode. 0101 = COMPARE Mode. 0110 = GATED Mode. 0111 = CAPTURE/COMPARE Mode. 1000 = PWM DUAL OUTPUT Mode. 1001 = CAPTURE RESTART Mode. 1010 = COMPARATOR COUNTER Mode.

ADC Data High Byte Register

The ADC Data High Byte Register, listed in Table 64, contains the upper eight bits of the ADC output. Access to the ADC Data High Byte Register is read-only. Reading the ADC Data High Byte Register latches data in the ADC Low Bits Register.

Table 64. ADC Data High Byte Register (ADCD_H)

Bit	7	6	5	4	3	2	1	0
Field	ADCDH							
RESET	X							
R/W	R							
Address	F72H							

Bit	Description
[7:0] ADCDH	**ADC High Byte** 00h–FFh = The last conversion output is held in the data registers until the next ADC conversion is completed.

ADC Data Low Bits Register

The ADC Data Low Bits Register, shown in Table 65, contains the lower bits of the ADC output. Access to the ADC Data Low Bits Register is read-only. Reading the ADC Data High Byte Register latches lower bits of the ADC in the ADC Data Low Bits Register.

Table 65. ADC Data Low Bits Register (ADCD_L)

Bit	7	6	5	4	3	2	1	0
Field	ADCDL		Reserved					
RESET	X		X					
R/W	R		R					
Address	F73H							

Bit	Description
[7:6] ADCDL	**ADC Low Bits** 00–11b = These bits are the two least-significant bits of the 10-bit ADC output. These bits are undefined after a reset. The low bits are latched into this register whenever the ADC Data High Byte Register is read.
[5:0]	**Reserved** These bits are reserved and must be programmed to 000000.

Comparator Control Register Definitions

The Comparator Control Register (CMP0) configures the comparator inputs and sets the value of the internal voltage reference. The GPIO pin is always used as positive comparator input.

Table 68. Comparator Control Register (CMP0)

Bit	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Field	Reserved	INNSEL	REFLVL				Reserved	
RESET	0	0	0	1	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F90H							

Bit	**Description**
[7]	**Reserved** This bit is reserved and must be programmed to 0.
[6] INNSEL	**Signal Select for Negative Input** 0 = internal reference disabled, GPIO pin used as negative comparator input. 1 = internal reference enabled as negative comparator input.
[5:2] REFLVL	**Internal Reference Voltage Level** This reference is independent of the ADC voltage reference. 0000 = 0.0V. 0001 = 0.2V. 0010 = 0.4V. 0011 = 0.6V. 0100 = 0.8V. 0101 = 1.0V (Default). 0110 = 1.2V. 0111 = 1.4V. 1000 = 1.6V. 1001 = 1.8V. 1010–1111 = Reserved.
[1:0]	**Reserved** These bits are reserved and must be programmed to 00.

Note: The bit values used in Table 87 are set at the factory; no calibration is required.

Table 88. VBO Trim Definition

VBO_TRIM	Trigger Voltage Level
000	1.7
001	1.6
101	2.2
110	2.0
100	2.4
111	1.8

On-chip Flash memory is only guaranteed to perform write operations when voltage supplies exceed 2.7V. Write operations at voltages below 2.7V will yield unpredictable results.

Table 89. Trim Option Bits at 0006H (TCLKFLT)

Bit	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
Field	DivBy4	Reserved	DlyCtl1	DlyCtl2	DlyCtl3	Reserved	FilterSel1	FilterSel0
RESET	0	1	0	0	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	Information Page Memory 0026H							
Note: U = Unchanged by Reset. R/W = Read/Write.								

Bit	Description
[7] DivBy4	**Output Frequency Selection** 0 = Output frequency is input frequency. 1 = Output frequency is 1/4 of the input frequency.
[6]	**Reserved** This bit is reserved and must be programmed to 1.
[5:3] DlyCtl*x*	**Delay Control** 3-bit selection for the pulse width that can be filtered. See Table 90 for Delay Control values at 3.3V operation voltage.
[2]	**Reserved** This bit is reserved and must be programmed to 1.
Notes: x indicates bit values 3–1; y indicates bit values 1–0.	

On-Chip Debugger

The Z8 Encore! devices contain an integrated On-Chip Debugger (OCD) that provides the following advanced debugging features:

- Reading and writing of the register file
- Reading and writing of program and data memory
- Setting of breakpoints and watchpoints
- Executing eZ8 CPU instructions

Architecture

The On-Chip Debugger consists of four primary functional blocks: transmitter, receiver, autobaud detector/generator and debug controller. Figure 20 displays the architecture of the On-Chip Debugger.

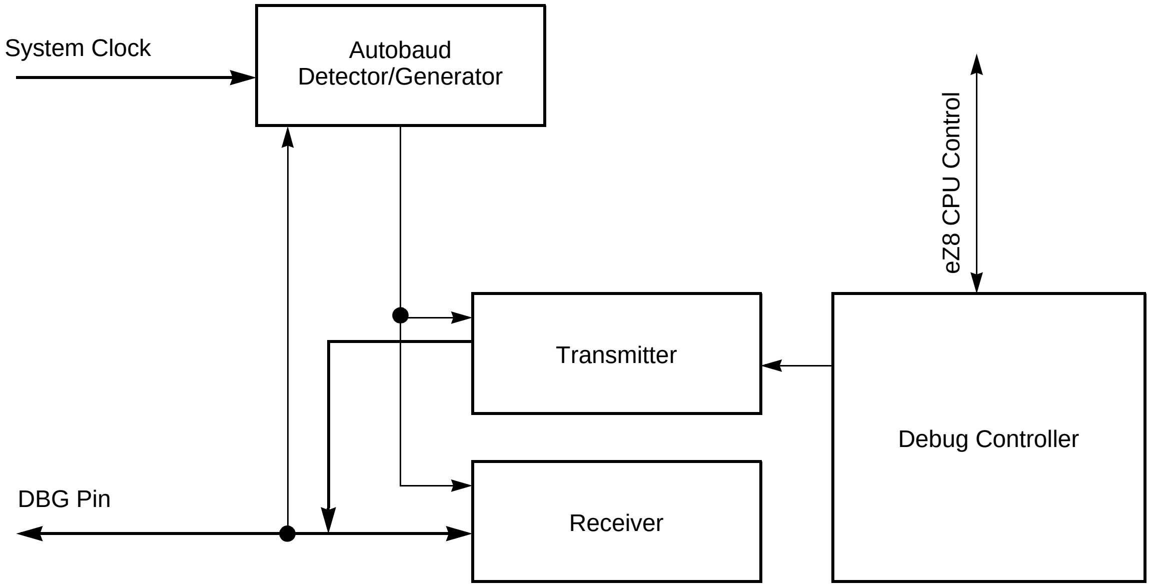

Figure 20. On-Chip Debugger Block Diagram

ory size and is approximately equal to the system clock period multiplied by the number of bytes in program memory.

```
DBG ← 0EH
DBG → CRC[15:8]
DBG → CRC[7:0]
```

Step Instruction (10H). The step instruction command, steps one assembly instruction at the current program counter (PC) location. If the device is not in DEBUG Mode or the Flash read protect option bit is enabled, the OCD ignores this command.

```
DBG ← 10H
```

Stuff Instruction (11H). The stuff instruction command, steps one assembly instruction and allows specification of the first byte of the instruction. The remaining 0–4 bytes of the instruction are read from program memory. This command is useful for stepping over instructions where the first byte of the instruction has been overwritten by a breakpoint. If the device is not in DEBUG Mode or the Flash read protect option bit is enabled, the OCD ignores this command.

```
DBG ← 11H
DBG ← opcode[7:0]
```

Execute Instruction (12H). The execute instruction command allows sending an entire instruction to be executed to the eZ8 CPU. This command can also step over breakpoints. The number of bytes to send for the instruction depends on the opcode. If the device is not in DEBUG Mode or the Flash read protect option bit is enabled, this command reads and discards one byte.

```
DBG ← 12H
DBG ← 1–5 byte opcode
```

On-Chip Debugger Control Register Definitions

This section describes the features of the On-Chip Debugger Control and Status registers.

OCD Control Register

The OCD Control Register controls the state of the On-Chip Debugger. This register is used to enter or exit DEBUG Mode and to enable the BRK instruction. It can also reset the Z8 Encore! F0830 Series device.

A reset and stop function can be achieved by writing 81H to this register. A *reset and go* function can be achieved by writing 41H to this register. If the device is in DEBUG Mode, a run function can be implemented by writing 40H to this register.

OCD Status Register

The OCD Status Register reports status information about the current state of the debugger and the system.

Table 97. OCD Status Register (OCDSTAT)

Bit	7	6	5	4	3	2	1	0
Field	DBG	HALT	FRPENB	Reserved				
RESET	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Bit	Description
[7] DBG	**Debug Status** 0 = NORMAL Mode. 1 = DEBUG Mode.
[6] HALT	**HALT Mode** 0 = Not in HALT Mode. 1 = In HALT Mode.
[5] FRPENB	**Flash Read Protect Option Bit Enable** 0 = FRP bit enabled, that allows disabling of many OCD commands. 1 = FRP bit has no effect.
[4:0]	**Reserved** These bits are reserved and must be programmed to 00000.

eZ8 CPU Instruction Set

This chapter describes the following features of the eZ8 CPU instruction set:

Assembly Language Programming Introduction

The eZ8 CPU assembly language provides a means for writing an application program without concern for actual memory addresses or machine instruction formats. A program written in assembly language is called a source program. Assembly language allows the use of symbolic addresses to identify memory locations. It also allows mnemonic codes (op codes and operands) to represent the instructions themselves. The op codes identify the instruction while the operands represent memory locations, registers or immediate data values.

Each assembly language program consists of a series of symbolic commands called statements. Each statement contains labels, operations, operands and comments.

Labels can be assigned to a particular instruction step in a source program. The label identifies that step in the program as an entry point for use by other instructions.

The assembly language also includes assembler directives that supplement the machine instruction. The assembler directives, or pseudo-ops, are not translated into a machine instruction. Rather, these pseudo-ops are interpreted as directives that control or assist the assembly process.

The source program is processed (assembled) by the assembler to obtain a machine language program called the object code. The object code is executed by the eZ8 CPU. An example segment of an assembly language program is provided in the following example.

Assembly Language Source Program Example

```
JP START          ; Everything after the semicolon is a comment.
START:            ; A label called “START”. The first instruction (JP START) in this
                  ; example causes program execution to jump to the point within the
                  ; program where the START label occurs.
LD R4, R7         ; A Load (LD) instruction with two operands. The first operand,
                  ; Working register R4, is the destination. The second operand,
                  ; Working register R7, is the source. The contents of R7 is
                  ; written into R4.
LD 234H, #%01     ; Another Load (LD) instruction with two operands.
                  ; The first operand, extended mode register Address 234H,
                  ; identifies the destination. The second operand, immediate data
                  ; value 01H, is the source. The value 01H is written into the
                  ; register at address 234H.
```

Assembly Language Syntax

For proper instruction execution, eZ8 CPU assembly language syntax requires that the operands be written as *destination, source*. After assembly, the object code usually reflects the operands in the order *source, destination*, but ordering is op code-dependent.

The following examples illustrate the format of some basic assembly instructions and the resulting object code produced by the assembler. This binary format must be followed by users that prefer manual program coding or intend to implement their own assembler.

Example 1

If the contents of registers `43H` and `08H` are added and the result is stored in `43H`, the assembly syntax and resulting object code is:

Table 101. Assembly Language Syntax Example 1

Assembly Language Code	`ADD`	`43H,`	`08H`	`(ADD dst, src)`
Object Code	`04`	`08`	`43`	`(OPC src, dst)`

Table 110. Logical Instructions

Mnemonic	Operands	Instruction
AND	dst, src	Logical AND
ANDX	dst, src	Logical AND using Extended Addressing
COM	dst	Complement
OR	dst, src	Logical OR
ORX	dst, src	Logical OR using Extended Addressing
XOR	dst, src	Logical Exclusive OR
XORX	dst, src	Logical Exclusive OR using Extended Addressing

Table 111. Program Control Instructions

Mnemonic	Operands	Instruction
BRK	—	On-chip Debugger Break
BTJ	p, bit, src, DA	Bit Test and Jump
BTJNZ	bit, src, DA	Bit Test and Jump if Non-Zero
BTJZ	bit, src, DA	Bit Test and Jump if Zero
CALL	dst	Call Procedure
DJNZ	dst, src, RA	Decrement and Jump Non-Zero
IRET	—	Interrupt Return
JP	dst	Jump
JP cc	dst	Jump Conditional
JR	DA	Jump Relative
JR cc	DA	Jump Relative Conditional
RET	—	Return
TRAP	vector	Software Trap

Table 112. Rotate and Shift Instructions

Mnemonic	Operands	Instruction
BSWAP	dst	Bit Swap
RL	dst	Rotate Left
RLC	dst	Rotate Left through Carry

Table 113. eZ8 CPU Instruction Summary (Continued)

Assembly		Address Mode		Op	Flags						Fetch	Instr.
Mnemonic	**Symbolic Operation**	**dst**	**src**	**Code(s) (Hex)**	**C**	**Z**	**S**	**V**	**D**	**H**	**Cycles**	**Cycles**
AND dst, src	dst ← dst AND src	r	r	52	–	*	*	0	–	–	2	3

Note: Flags Notation:
* = Value is a function of the result of the operation.
– = Unaffected.
X = Undefined.
0 = Reset to 0.
1 = Set to 1.

DC Characteristics

Table 116 lists the DC characteristics of the Z8 Encore! F0830 Series products. All voltages are referenced to V_{SS}, the primary system ground.

Table 116. DC Characteristics

		T_A = 0°C to +70°C			T_A = –40°C to +105°C				
Symbol	**Parameter**	**Min**	**Typ**	**Max**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
V_{DD}	Supply Voltage				2.7	–	3.6	V	Power supply noise not to exceed 100 mV peak to peak
V_{IL1}	Low Level Input Voltage				–0.3	–	0.3*V_{DD}	V	For all input pins except $\overline{\text{RESET}}$.
V_{IL2}	Low Level Input Voltage				–0.3	–	0.8	V	For $\overline{\text{RESET}}$.
V_{IH1}	High Level Input Voltage				2.0	–	5.5	V	For all input pins without analog or oscillator function.
V_{IH2}	High Level Input Voltage				2.0	–	V_{DD}+0.3	V	For those pins with analog or oscillator function.
V_{OL1}	Low Level Output Voltage				–	–	0.4	V	I_{OL} = 2 mA; V_{DD} = 3.0 V High Output Drive disabled.
V_{OH1}	High Level Output Voltage				2.4	–	–	V	I_{OH} = –2 mA; V_{DD} = 3.0 V High Output Drive disabled.
V_{OL2}	Low Level Output Voltage				–	–	0.6	V	I_{OL} = 20 mA; V_{DD} = 3.3 V High Output Drive enabled.
V_{OH2}	High Level Output Voltage				2.4	–	–	V	I_{OH} = –20 mA; V_{DD} = 3.3 V High Output Drive enabled.
I_{IL}	Input Leakage Current				–5	–	+5	µA	V_{DD} = 3.6 V; V_{IN} = V_{DD} or V_{SS}[1]
I_{TL}	Tristate Leakage Current				–5	–	+5	µA	V_{DD} = 3.6 V

Notes:
1. This condition excludes all pins that have on-chip pull-ups, when driven Low.
2. These values are provided for design guidance only and are not tested in production.
3. See Figure 31 for HALT Mode current.

Table 119. Flash Memory Electrical Characteristics and Timing

	V_{DD} = 2.7 to 3.6V T_A = 0°C to +70°C			V_{DD} = 2.7 to 3.6V T_A = –40°C to +105°C				
Parameter	**Min**	**Typ**	**Max**	**Min**	**Typ**	**Max**	**Units**	**Notes**
Flash Byte Read Time				50	–	–	ns	
Flash Byte Program Time				20	–	–	µs	
Flash Page Erase Time				50	–	–	ms	
Flash Mass Erase Time				50	–	–	ms	
Writes to Single Address Before Next Erase				–	–	2		
Flash Row Program Time				–	–	8	ms	Cumulative program time for single row cannot exceed limit before next erase. This parameter is only an issue when bypassing the Flash Controller.
Data Retention				10	–	–	years	25°C
Endurance				10,000	–	–	cycles	Program/erase cycles

Table 120. Watchdog Timer Electrical Characteristics and Timing

		V_{DD} = 2.7 to 3.6V T_A = 0°C to +70°C			V_{DD} = 2.7 - 3.6V T_A = –40°C to +105°C				
Symbol	**Parameter**	**Min**	**Typ**	**Max**	**Min**	**Typ**	**Max**	**Units**	**Conditions**

Part Number Suffix Designations

Zilog part numbers consist of a number of components, as indicated in the following example.

Example. Part number Z8F0830SH020SG is an 8-bit 20MHz Flash MCU with 8KB Program Memory and equipped with ADC and NVDS in a 20-pin SOIC package, operating within a 0ºC to +70ºC temperature range and built using lead-free solder.
