Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

2 Overview

This datasheet describes PolarFire® FPGA device characteristics with industrial temperature range (–40 °C to 100 °C T_J) and extended commercial temperature range (0 °C to 100 °C T_J). The devices are provided with a standard speed grade (STD) and a –1 speed grade with higher performance. The FPGA core supply V_{DD} can operate at 1.0 V for lower-power or 1.05 V for higher performance. Similarly, the transceiver core supply V_{DDA} can also operate at 1.0 V or 1.05 V. Users select the core operating voltage while creating the Libero project.

6.2.1 DC Characteristics over Recommended Operating Conditions

The following table lists the DC characteristics over recommended operating conditions.

1. Represents the die input capacitance at the pad not the package.
2. Voltage ramp must be monotonic.
3. Numbers based on rail-to-rail input signal swing and minimum 1 V/ns and maximum 4 V/ns. These are to be used for input delay measurement consistency.
4. I/O signal standards with smaller than rail-to-rail input swings can use a nominal value of 200 ps 20%–80% of swing and maximum value of 500 ps 20%–80% of swing.
5. GPIO only.

6.2.2 Maximum Allowed Overshoot and Undershoot

During transitions, input signals may overshoot and undershoot the voltage shown in the following table. Input currents must be limited to less than 100 mA per latch-up specifications.

The maximum overshoot duration is specified as a high-time percentage over the lifetime of the device. A DC signal is equivalent to 100% of the duty-cycle.

The following table shows the maximum AC input voltage (V_{IN}) overshoot duration for HSIO.

Table 6 • Maximum Overshoot During Transitions for HSIO

6.2.2.1 Power-Supply Ramp Times

The following table shows the allowable power-up ramp times. Times shown correspond to the ramp of the supply from 0 V to the minimum recommended voltage as specified in the section Recommended Operating Conditions (see page 6). All supplies must rise and fall monotonically.

Table 10 • Power-Supply Ramp Times

Parameter	Symbol	Min	Max	Unit
FPGA core supply	V_{DD}	0.2	50	ms
Transceiver core supply	V_{DDA}	0.2	50	ms
Must connect to 1.8 V supply	V_{DD18}	0.2	50	ms
Must connect to 2.5 V supply	V_{DD25}	0.2	50	ms
Must connect to 2.5 V supply	V_{DDA25}	0.2	50	ms
HSIO bank I/O power supplies	$V_{DDI[0,1,6,7]}$	0.2	50	ms
GPIO bank I/O power supplies	$V_{DDI[2,4,5]}$	0.2	50	ms
Bank 3 dedicated I/O buffers (GPIO)	V_{DDI3}	0.2	50	ms
GPIO bank auxiliary power supplies	$V_{DDAUX[2,4,5]}$	0.2	50	ms
Transceiver reference clock supply	$V_{DD\_XCVR\_CLK}$	0.2	50	ms
Global V_{REF} for transceiver reference clocks	$XCVR_{VREF}$	0.2	50	ms

Note: For proper operation of programming recovery mode, if a VDD supply brownout occurs during programming, a minimum supply ramp down time for only the VDD supply is recommended to be 10 ms or longer by using a programmable regulator or on-board capacitors.

6.2.2.2 Hot Socketing

The following table lists the hot-socketing DC characteristics over recommended operating conditions.

Table 11 • Hot Socketing DC Characteristics over Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Condition
Current per transceiver Rx input pin (P or N single-ended)[1, 2]	I_{XCVRRX_HS}			±4	mA	V_{DDA} = 0 V
Current per transceiver Tx output pin (P or N single-ended)[3]	I_{XCVRTX_HS}			±10	mA	V_{DDA} = 0 V
Current per transceiver reference clock input pin (P or N single-ended)[4]	$I_{XCVRREF\_HS}$			±1	mA	$V_{DD\_XCVR\_CLK}$ = 0 V
Current per GPIO pin (P or N single-ended)[5]	I_{GPIO_HS}			±1	mA	V_{DDIx} = 0 V
Current per HSIO pin (P or N single-ended)						Hot socketing is not supported in HSIO.

1. Assumes that the device is powered-down, all supplies are grounded, AC-coupled interface, and input pin pairs are driven by a CML driver at the maximum amplitude (1 V pk–pk) that is toggling at any rate with PRBS7 data.
2. Each P and N transceiver input has less than the specified maximum input current.
3. Each P and N transceiver output is connected to a 40 Ω resistor (50 Ω CML termination – 20% tolerance) to the maximum allowed output voltage (V_{DDAmax} + 0.3 V = 1.4 V) through an AC-coupling capacitor with all PolarFire device supplies grounded. This shows the current for a worst-case DC coupled interface. As an AC-coupled interface, the output signal will settle at ground and no hot socket current will be seen.
4. $V_{DD\_XCVR\_CLK}$ is powered down and the device is driven to $–0.3\ V < V_{IN} < V_{DD\_XCVR\_CLK}$.
5. V_{DDIx} is powered down and the device is driven to $–0.3\ V < V_{IN} <$ GPIO V_{DDImax}.

Note: The following dedicated pins do not support hot socketing: TMS, TDI, TRSTB, DEVRST_N, and FF_EXIT_N. Weak pull-up (as specified in GPIO) is always enabled.

6.3 Input and Output

The following section describes:

- DC I/O levels
- Differential and complementary differential DC I/O levels
- HSIO and GPIO on-die termination specifications
- LVDS specifications

6.3.1 DC Input and Output Levels

The following tables list the DC I/O levels.

1. V_{ICM} is the input common mode.
2. V_{ID} is the input differential voltage.
3. V_{ICM} rules are as follows:
   a. V_{ICM} must be less than V_{DDI} – 0.4 V;
   b. V_{ICM} + V_{ID}/2 must be <V_{DDI} + 0.4 V;
   c. V_{ICM} – V_{ID}/2 must be >VSS – 0.3 V;
   d. Any differential input with V_{ICM} ≤0.6 V requires the low common mode setting in Libero (VICM_RANGE=LOW).
4. VDDI = 1.8 V, VDDAUX = 2.5 V.
5. HSIO receiver only.
6. GPIO receiver only.

1. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst-case of these measurements. V_{REF} values listed are typical. Input waveform switches between V_L and V_H. All rise and fall times must be 1 V/ns.
2. Differential receiver standards all use 250 mV V_{ID} for timing. V_{CM} is different between different standards.
3. Input voltage level from which measurement starts.
4. The value given is the differential input voltage.
5. This is an input voltage reference that bears no relation to the V_{REF}/V_{MEAS} parameters found in IBIS models or shown in Output Delay Measurement—Single-Ended Test Setup (see page 27).
6. Emulated bi-directional interface.

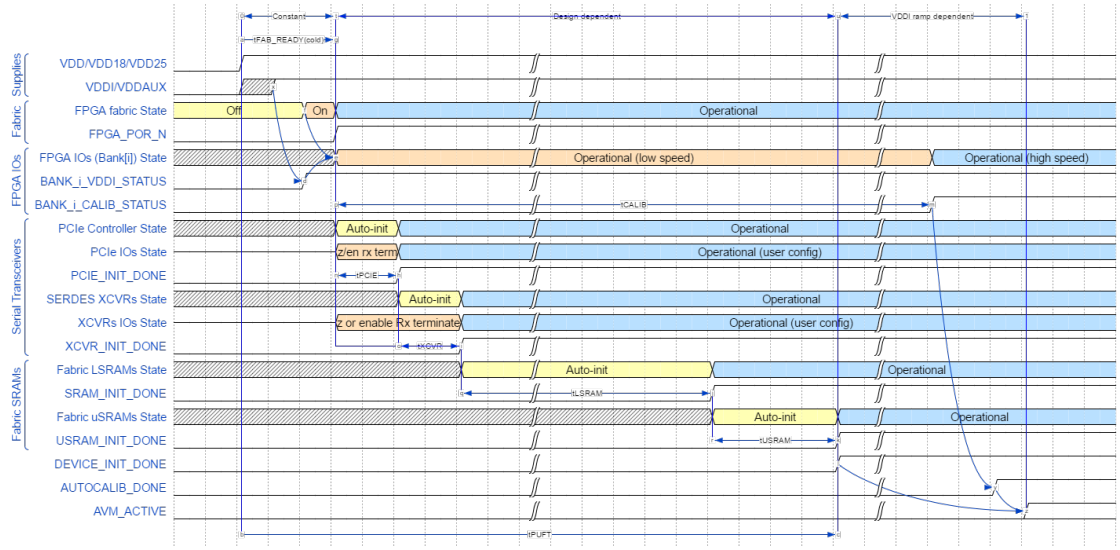
Figure 5 • Cold Reset Timing



Notes:

- The previous diagram showsthe case where VDDI/VDDAUX of I/O banks are powered either before or sufficiently soon after VDD/VDD18/VDD25 that the I/O bank enable time is measured from the assertion time of VDD/VDD18/VDD25 (that is, the PUFT specification). If VDDI/VDDAUX of I/O banks are powered sufficiently after VDD/VDD18/VDD25, then the I/O bank enable time is measured from the assertion of VDDI/VDDAUX and is not specified by the PUFT specification. In this case, I/O operation is indicated by the assertion of BANK_i_VDDI_STATUS, rather than being measured relative to FABRIC_POR_N negation.
- AUTOCALIB_DONE assertion indicates the completion of calibration for any I/O banks specified by the user for auto-calibration. AUTOCALIB_DONE asserts independently of DEVICE_INIT_DONE. It may assert before or after DEVICE_INIT_DONE and is determined by the following:
  - How long after VDD/VDD18/VDD25 that VDDI/VDDAUX are powered on. Note that if any of the user-specified I/O banks are not powered on within the auto-calibration timeout window, then AUTOCALIB_DONE doesn't assert until after this timeout.
  - The specified ramp times of VDDI of each I/O bank designated for auto-calibration.
  - How much auto-initialization is to be performed for the PCIe, SERDES transceivers, and fabric LSRAMs.
- If any of the I/O banks specified for auto-calibration do not have their VDDI/VDDAUX powered on within the auto-calibration timeout window, then it will be approximately auto-calibrated whenever VDDI/VDDAUX is subsequently powered on. To obtain an accurate calibration however, on such IO banks, it is necessary to initiate a re-calibration (using CALIB_START from fabric).
- AVM_ACTIVE only asserts if avionics mode is being used. It is asserted when the later of DEVICE_INIT_DONE or AUTOCALIB_DONE assert.

7.9.2 Warm Reset Initialization Sequence

The following warm reset timing diagram shows the initialization sequencing of the device when either DEVRST_N or TAMPER_RESET_DEVICE signals are asserted.

7.9.4 Design Dependence of T PUFT and T WRFT

Some phases of the device initialization are user design-dependent, as the device automatically initializes certain resources to user-specified configurations if those resources are used in the design. It is necessary to compute the overall power-up to functional time by referencing the following tables and adding the relevant phases, according to the design configuration. The following equation refers to timing parameters specified in the above timing diagrams. Please note T_{PCIE} , T_{XCVR}, T_{LSRAM}, and T_{USRAM} can be found in the PolarFire FPGA device power-up and resets user guide UG0725.

$T_{PUFT} = T_{FAB\_READY(cold)} + \max((T_{PCIE} + T_{XCVR} + T_{LSRAM} + T_{USRAM}), T_{CALIB})$

$T_{WRFT} = T_{FAB\_READY(warm)} + \max((T_{PCIE} + T_{XCVR} + T_{LSRAM} + T_{USRAM}), T_{CALIB})$

Note: T_{PCIE}, T_{XCVR}, T_{LSRAM}, T_{USRAM}, and T_{CALIB} are common to both cold and warm reset scenarios.

Auto-initialization of FPGA (if required) occurs in parallel with I/O calibration. The device may be considered fully functional only when the later of these two activities has finished, which may be either one, depending on the configuration, as may be calculated from the following tables. Note that I/O calibration may extend beyond T_{PUFT} (as I/O calibration process is independent of main device power-on and is instead dependent on I/O bank supply relative power-on time and ramp times). The previous timing diagram for power-on initialization shows the earliest that I/Os could be enabled, if the I/O power supplies are powered on before or at the same time as the main supplies.

7.9.5 Cold Reset to Fabric and I/Os (Low Speed) Functional

The following table specifies the minimum, typical, and maximum times from the power supplies reaching the above trip point levels until the FPGA fabric is operational and the FPGA IOs are functional for low-speed (sub 400 MHz) operation.

Table 99 • Cold Boot

Power-On (Cold) Reset to Fabric and I/O Operational	Min	Typ	Max	Unit
Time when input pins start working – $T_{IN\_ACTIVE(cold)}$	1.17	4.51	7.84	ms
Time when weak pull-ups are enabled – $T_{PU\_PD\_ACTIVE(cold)}$	1.17	4.51	7.84	ms
Time when fabric is operational – $T_{FAB\_READY(cold)}$	1.20	4.54	7.87	ms
Time when output pins start driving – $T_{OUT\_ACTIVE(cold)}$	1.22	4.56	7.89	ms

7.9.6 Warm Reset to Fabric and I/Os (Low Speed) Functional

The following table specifies the minimum, typical, and maximum times from the negation of the warm reset event until the FPGA fabric is operational and the FPGA IOs are functional for low-speed (sub 400 MHz) operation.

Table 100 • Warm Boot

Warm Reset to Fabric and I/O Operational	Min	Typ	Max	Unit
Time when input pins start working – $T_{IN\_ACTIVE(warm)}$	0.91	1.76	2.62	ms
Time when weak pull-ups/pull-downs are enabled – $T_{PU\_PD\_ACTIVE(warm)}$	0.91	1.76	2.62	ms
Time when fabric is operational – $T_{FAB\_READY(warm)}$	0.94	1.79	2.65	ms
Time when output pins start driving – $T_{OUT\_ACTIVE(warm)}$	0.96	1.81	2.67	ms

7.9.7 Miscellaneous Initialization Parameters

In the following table, T_{FAB_READY} refers to either $T_{FAB\_READY(cold)}$ or $T_{FAB\_READY(warm)}$ as specified in the previous tables, depending on whether the initialization is occurring as a result of a cold or warm reset, respectively.
