Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

The maximum overshoot duration is specified as a high-time percentage over the lifetime of the device. A DC signal is equivalent to 100% of the duty-cycle.

6.2.2.1 Power-Supply Ramp Times

The following table shows the allowable power-up ramp times. Times shown correspond to the ramp of the supply from 0 V to the minimum recommended voltage as specified in the section Recommended Operating Conditions (see page 6). All supplies must rise and fall monotonically.

Table 10 • Power-Supply Ramp Times

Parameter	Symbol	Min	Max	Unit
FPGA core supply	V_{DD}	0.2	50	ms
Transceiver core supply	V_{DDA}	0.2	50	ms
Must connect to 1.8 V supply	V_{DD18}	0.2	50	ms
Must connect to 2.5 V supply	V_{DD25}	0.2	50	ms
Must connect to 2.5 V supply	V_{DDA25}	0.2	50	ms
HSIO bank I/O power supplies	$V_{DDI[0,1,6,7]}$	0.2	50	ms
GPIO bank I/O power supplies	$V_{DDI[2,4,5]}$	0.2	50	ms
Bank 3 dedicated I/O buffers (GPIO)	V_{DDI3}	0.2	50	ms
GPIO bank auxiliary power supplies	$V_{DDAUX[2,4,5]}$	0.2	50	ms
Transceiver reference clock supply	$V_{DD\_XCVR\_CLK}$	0.2	50	ms
Global V_{REF} for transceiver reference clocks	$XCVR_{VREF}$	0.2	50	ms

Note: For proper operation of programming recovery mode, if a VDD supply brownout occurs during programming, a minimum supply ramp down time for only the VDD supply is recommended to be 10 ms or longer by using a programmable regulator or on-board capacitors.

6.2.2.2 Hot Socketing

The following table lists the hot-socketing DC characteristics over recommended operating conditions.

Table 11 • Hot Socketing DC Characteristics over Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit	Condition
Current per transceiver Rx input pin (P or N single-ended)[1, 2]	XCVRRX_HS			±4	mA	V_{DDA} = 0 V
Current per transceiver Tx output pin (P or N single-ended)[3]	XCVRTX_HS			±10	mA	V_{DDA} = 0 V
Current per transceiver reference clock input pin (P or N single-ended)[4]	XCVRREF_HS			±1	mA	$V_{DD\_XCVR\_CLK}$ = 0 V
Current per GPIO pin (P or N single-ended)[5]	I_{GPIO_HS}			±1	mA	V_{DDIx} = 0 V
Current per HSIO pin (P or N single-ended)						Hot socketing is not supported in HSIO.

1. Assumes that the device is powered-down, all supplies are grounded, AC-coupled interface, and input pin pairs are driven by a CML driver at the maximum amplitude (1 V pk–pk) that is toggling at any rate with PRBS7 data.
2. Each P and N transceiver input has less than the specified maximum input current.
3. Each P and N transceiver output is connected to a 40 Ω resistor (50 Ω CML termination – 20% tolerance) to the maximum allowed output voltage (V_{DDAmax} + 0.3 V = 1.4 V) through an AC-coupling capacitor with all PolarFire device supplies grounded. This shows the current for a worst-case DC coupled interface. As an AC-coupled interface, the output signal will settle at ground and no hot socket current will be seen.
4. $V_{DD\_XCVR\_CLK}$ is powered down and the device is driven to –0.3 V < V_{IN} < $V_{DD\_XCVR\_CLK}$.
5. V_{DDIx} is powered down and the device is driven to –0.3 V < V_{IN} < GPIO V_{DDImax}.

Note: The following dedicated pins do not support hot socketing: TMS, TDI, TRSTB, DEVRST_N, and FF_EXIT_N. Weak pull-up (as specified in GPIO) is always enabled.

1. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst-case of these measurements. V_{REF} values listed are typical. Input waveform switches between V_L and V_H. All rise and fall times must be 1 V/ns.
2. Differential receiver standards all use 250 mV V_{ID} for timing. V_{CM} is different between different standards.
3. Input voltage level from which measurement starts.
