### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Active
Number of LABs/CLBs	29080
Number of Logic Elements/Cells	77000
Total RAM Bits	5001216
Number of I/O	224
Number of Gates	-
Voltage - Supply	1.07V ~ 1.13V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-FBGA
Supplier Device Package	484-UBGA (19x19)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/5ceba5u19c7n">https://www.e-xfl.com/product-detail/intel/5ceba5u19c7n</a>

## Cyclone V Device Overview

The Cyclone® V devices are designed to simultaneously accommodate the shrinking power consumption, cost, and time-to-market requirements; and the increasing bandwidth requirements for high-volume and cost-sensitive applications.

Enhanced with integrated transceivers and hard memory controllers, the Cyclone V devices are suitable for applications in the industrial, wireless and wireline, military, and automotive markets.

## Key Advantages of Cyclone V Devices

**Table 1. Key Advantages of the Cyclone V Device Family**

Advantage	Supporting Feature
Lower power consumption	<ul style="list-style-type: none"> <li>Built on TSMC's 28 nm low-power (28LP) process technology and includes an abundance of hard intellectual property (IP) blocks</li> <li>Up to 40% lower power consumption than the previous generation device</li> </ul>
Improved logic integration and differentiation capabilities	<ul style="list-style-type: none"> <li>8-input adaptive logic module (ALM)</li> <li>Up to 13.59 megabits (Mb) of embedded memory</li> <li>Variable-precision digital signal processing (DSP) blocks</li> </ul>
Increased bandwidth capacity	<ul style="list-style-type: none"> <li>3.125 gigabits per second (Gbps) and 6.144 Gbps transceivers</li> <li>Hard memory controllers</li> </ul>
Hard processor system (HPS) with integrated Arm* Cortex*-A9 MPCore* processor	<ul style="list-style-type: none"> <li>Tight integration of a dual-core Arm Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Cyclone V system-on-a-chip (SoC)</li> <li>Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric</li> </ul>
Lowest system cost	<ul style="list-style-type: none"> <li>Requires only two core voltages to operate</li> <li>Available in low-cost wirebond packaging</li> <li>Includes innovative features such as Configuration via Protocol (CvP) and partial reconfiguration</li> </ul>

## Summary of Cyclone V Features

**Table 2. Summary of Features for Cyclone V Devices**

Feature	Description	
Technology	<ul style="list-style-type: none"> <li>TSMC's 28-nm low-power (28LP) process technology</li> <li>1.1 V core voltage</li> </ul>	
Packaging	<ul style="list-style-type: none"> <li>Wirebond low-halogen packages</li> <li>Multiple device densities with compatible package footprints for seamless migration between different device densities</li> <li>RoHS-compliant and leaded<sup>(1)</sup> options</li> </ul>	
High-performance FPGA fabric	Enhanced 8-input ALM with four registers	
Internal memory blocks	<ul style="list-style-type: none"> <li>M10K—10-kilobits (Kb) memory blocks with soft error correction code (ECC)</li> <li>Memory logic array block (MLAB)—640-bit distributed LUTRAM where you can use up to 25% of the ALMs as MLAB memory</li> </ul>	
Embedded Hard IP blocks	Variable-precision DSP	<ul style="list-style-type: none"> <li>Native support for up to three signal processing precision levels (three 9 x 9, two 18 x 18, or one 27 x 27 multiplier) in the same variable-precision DSP block</li> <li>64-bit accumulator and cascade</li> <li>Embedded internal coefficient memory</li> <li>Padder/subtractor for improved efficiency</li> </ul>
	Memory controller	DDR3, DDR2, and LPDDR2 with 16 and 32 bit ECC support
	Embedded transceiver I/O	PCI Express* (PCIe*) Gen2 and Gen1 (x1, x2, or x4) hard IP with multifunction support, endpoint, and root port
Clock networks	<ul style="list-style-type: none"> <li>Up to 550 MHz global clock network</li> <li>Global, quadrant, and peripheral clock networks</li> <li>Clock networks that are not used can be powered down to reduce dynamic power</li> </ul>	
Phase-locked loops (PLLs)	<ul style="list-style-type: none"> <li>Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB)</li> <li>Integer mode and fractional mode</li> </ul>	
FPGA General-purpose I/Os (GPIOs)	<ul style="list-style-type: none"> <li>875 megabits per second (Mbps) LVDS receiver and 840 Mbps LVDS transmitter</li> <li>400 MHz/800 Mbps external memory interface</li> <li>On-chip termination (OCT)</li> <li>3.3 V support with up to 16 mA drive strength</li> </ul>	
Low-power high-speed serial interface	<ul style="list-style-type: none"> <li>614 Mbps to 6.144 Gbps integrated transceiver speed</li> <li>Transmit pre-emphasis and receiver equalization</li> <li>Dynamic partial reconfiguration of individual channels</li> </ul>	
HPS (Cyclone V SE, SX, and ST devices only)	<ul style="list-style-type: none"> <li>Single or dual-core Arm Cortex-A9 MPCore processor-up to 925 MHz maximum frequency with support for symmetric and asymmetric multiprocessing</li> <li>Interface peripherals—10/100/1000 Ethernet media access control (EMAC), USB 2.0 On-The-Go (OTG) controller, quad serial peripheral interface (QSPI) flash controller, NAND flash controller, Secure Digital/MultiMediaCard (SD/MMC) controller, UART, controller area network (CAN), serial peripheral interface (SPI), I<sup>2</sup>C interface, and up to 85 HPS GPIO interfaces</li> <li>System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers</li> <li>On-chip RAM and boot ROM</li> </ul>

## Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

## Types of Embedded Memory

The Cyclone V devices contain two types of memory blocks:

- 10 Kb M10K blocks—blocks of dedicated memory resources. The M10K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Cyclone V devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

## Embedded Memory Capacity in Cyclone V Devices

**Table 18. Embedded Memory Capacity and Distribution in Cyclone V Devices**

Variant	Member Code	M10K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)

	D6	553	5,530	994	621	6,151

## Embedded Memory Configurations

**Table 19. Supported Embedded Memory Block Configurations for Cyclone V Devices**

This table lists the maximum configurations supported for the embedded memory blocks. The information is applicable only to the single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
M10K	256	x40 or x32
	512	x20 or x16
	1K	x10 or x8
	2K	x5 or x4
	4K	x2
	8K	x1

## Clock Networks and PLL Clock Sources

550 MHz Cyclone V devices have 16 global clock networks capable of up to operation. The clock network architecture is based on Intel's global, quadrant, and peripheral clock structure. This clock structure is supported by dedicated clock input pins and fractional PLLs.

**Note:** To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

## External Memory Performance

**Table 20. External Memory Interface Performance in Cyclone V Devices**

The maximum and minimum operating frequencies depend on the memory interface standards and the supported delay-locked loop (DLL) frequency listed in the device datasheet.

Interface	Voltage (V)	Maximum Frequency (MHz)		Minimum Frequency (MHz)
		Hard Controller	Soft Controller	
DDR3 SDRAM	1.5	400	303	303
	1.35	400	303	303
DDR2 SDRAM	1.8	400	300	167
LPDDR2 SDRAM	1.2	333	300	167

## Low-Power Serial Transceivers

Cyclone V devices deliver the industry's lowest power 6.144 Gbps transceivers at an estimated 88 mW maximum power consumption per channel. Cyclone V transceivers are designed to be compliant with a wide range of protocols and data rates.

## Transceiver Channels

The transceivers are positioned on the left outer edge of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

**Figure 10. Device Chip Overview for Cyclone V GX and GT Devices**

The figure shows a Cyclone V FPGA with transceivers. Different Cyclone V devices may have a different floorplans than the one shown here.

## PMA Features

To prevent core and I/O noise from coupling into the transceivers, the PMA block is isolated from the rest of the chip—ensuring optimal signal integrity. For the transceivers, you can use the channel PLL of an unused receiver PMA as an additional transmit PLL.

**Table 22. PMA Features of the Transceivers in Cyclone V Devices**

Features	Capability
Backplane support	Driving capability up to 6.144 Gbps
PLL-based clock recovery	Superior jitter tolerance
Programmable deserialization and word alignment	Flexible deserialization width and configurable word alignment pattern
Equalization and pre-emphasis	<ul style="list-style-type: none"> <li>Up to 14.37 dB of pre-emphasis and up to 4.7 dB of equalization</li> <li>No decision feedback equalizer (DFE)</li> </ul>
Ring oscillator transmit PLLs	614 Mbps to 6.144 Gbps
Input reference clock range	20 MHz to 400 MHz
Transceiver dynamic reconfiguration	Allows the reconfiguration of a single channel without affecting the operation of other channels

## PCS Features

The Cyclone V core logic connects to the PCS through an 8, 10, 16, 20, 32, or 40 bit interface, depending on the transceiver data rate and protocol. Cyclone V devices contain PCS hard IP to support PCIe Gen1 and Gen2, Gbps Ethernet (GbE), Serial RapidIO® (SRIO), and Common Public Radio Interface (CPRI).

Most of the standard and proprietary protocols from 614 Mbps to 6.144 Gbps are supported.

**Table 23. Transceiver PCS Features for Cyclone V Devices**

PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
3-Gbps and 6-Gbps Basic	0.614 to 6.144	<ul style="list-style-type: none"> <li>Phase compensation FIFO</li> <li>Byte serializer</li> <li>8B/10B encoder</li> <li>Transmitter bit-slip</li> </ul>	<ul style="list-style-type: none"> <li>Word aligner</li> <li>Deskew FIFO</li> <li>Rate-match FIFO</li> <li>8B/10B decoder</li> <li>Byte deserializer</li> <li>Byte ordering</li> <li>Receiver phase compensation FIFO</li> </ul>
PCIe Gen1 (x1, x2, x4)	2.5 and 5.0	<ul style="list-style-type: none"> <li>Dedicated PCIe PHY IP core</li> <li>PIPE 2.0 interface to the core logic</li> </ul>	<ul style="list-style-type: none"> <li>Dedicated PCIe PHY IP core</li> <li>PIPE 2.0 interface to the core logic</li> </ul>
PCIe Gen2 (x1, x2, x4) <sup>(12)</sup>			
GbE	1.25	<ul style="list-style-type: none"> <li>Custom PHY IP core with preset feature</li> <li>GbE transmitter synchronization state machine</li> </ul>	<ul style="list-style-type: none"> <li>Custom PHY IP core with preset feature</li> <li>GbE receiver synchronization state machine</li> </ul>
XAUI <sup>(13)</sup>	3.125	<ul style="list-style-type: none"> <li>Dedicated XAUI PHY IP core</li> <li>XAUI synchronization state machine for bonding four channels</li> </ul>	<ul style="list-style-type: none"> <li>Dedicated XAUI PHY IP core</li> <li>XAUI synchronization state machine for realigning four channels</li> </ul>
HiGig	3.75		
SRIO 1.3 and 2.1	1.25 to 3.125	<ul style="list-style-type: none"> <li>Custom PHY IP core with preset feature</li> <li>SRIO version 2.1-compliant x2 and x4 channel bonding</li> </ul>	<ul style="list-style-type: none"> <li>Custom PHY IP core with preset feature</li> <li>SRIO version 2.1-compliant x2 and x4 deskew state machine</li> </ul>
SDI, SD/HD, and 3G-SDI	0.27 <sup>(14)</sup> , 1.485, and 2.97	Custom PHY IP core with preset feature	Custom PHY IP core with preset feature
JESD204A	0.3125 <sup>(15)</sup> to 3.125		

*continued...*

<sup>(12)</sup> PCIe Gen2 is supported for Cyclone V GT and ST devices. The PCIe Gen2 x4 support is PCIe-compatible.

<sup>(13)</sup> XAUI is supported through the soft PCS.

<sup>(14)</sup> The 0.27-Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.

<sup>(15)</sup> The 0.3125-Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.

PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
Serial ATA Gen1 and Gen2	1.5 and 3.0	<ul style="list-style-type: none"><li>Custom PHY IP core with preset feature</li><li>Electrical idle</li></ul>	<ul style="list-style-type: none"><li>Custom PHY IP core with preset feature</li><li>Signal detect</li><li>Wider spread of asynchronous SSC</li></ul>
CPRI 4.1 <sup>(16)</sup>	0.6144 to 6.144	<ul style="list-style-type: none"><li>Dedicated deterministic latency PHY IP core</li><li>Transmitter (TX) manual bit-slip mode</li></ul>	<ul style="list-style-type: none"><li>Dedicated deterministic latency PHY IP core</li><li>Receiver (RX) deterministic latency state machine</li></ul>
OBSAI RP3	0.768 to 3.072

DisplayPort 1.2 <sup>(17)</sup>	1.62 and 2.7		

## SoC with HPS

Each SoC combines an FPGA fabric and an HPS in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

## HPS Features

The HPS consists of a dual-core Arm Cortex-A9 MPCore processor, a rich set of peripherals, and a shared multiport SDRAM memory controller, as shown in the following figure.

---

<sup>(16)</sup> High-voltage output mode (1000-BASE-CX) is not supported.

<sup>(17)</sup> Pending characterization.

**Figure 11. HPS with Dual-Core Arm Cortex-A9 MPCore Processor**

## System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals to interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports Arm CoreSight debug and core traces to facilitate software development.

## HPS-FPGA AXI Bridges

The HPS-FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA®) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to slaves in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS-FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS-FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

## HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features. The SDRAM controller subsystem supports DDR2, DDR3, or LPDDR2 devices up to 4 Gb in density operating at up to 400 MHz (800 Mbps data rate).

## FPGA Configuration and Processor Booting

The FPGA fabric and HPS in the SoC are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power, or shut down the entire FPGA fabric to reduce total system power.

You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- You can power up both the HPS and the FPGA fabric together, configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

**Note:** Although the FPGA fabric and HPS are on separate power domains, the HPS must remain powered up during operation while the FPGA fabric can be powered up or down as required.

#### **Related Information**

##### [Cyclone V Device Family Pin Connection Guidelines](#)

Provides detailed information about power supply pin connection guidelines and power regulator sharing.

## **Hardware and Software Development**

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer (Standard) system integration tool in the Intel Quartus Prime software.

For software development, the Arm-based SoC devices inherit the rich software development ecosystem available for the Arm Cortex-A9 MPCore processor. The software development process for Intel SoCs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux, VxWorks®, and other operating systems is available for the SoCs. For more information on the operating systems support availability, contact the Intel sales team.

You can begin device-specific firmware and software development on the Intel SoC Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board that runs on a PC. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

## **Dynamic and Partial Reconfiguration**

The Cyclone V devices support dynamic reconfiguration and partial reconfiguration.

### **Dynamic Reconfiguration**

The dynamic reconfiguration feature allows you to dynamically change the transceiver data rates, PMA settings, or protocols of a channel, without affecting data transfer on adjacent channels. This feature is ideal for applications that require on-the-fly multiprotocol or multirate support. You can reconfigure the PMA and PCS blocks with dynamic reconfiguration.

### **Partial Reconfiguration**

**Note:** The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Intel sales representatives.

Partial reconfiguration allows you to reconfigure part of the device while other sections of the device remain operational. This capability is important in systems with critical uptime requirements because it allows you to make updates or adjust functionality without disrupting services.

Apart from lowering cost and power consumption, partial reconfiguration increases the effective logic density of the device because placing device functions that do not operate simultaneously is not necessary. Instead, you can store these functions in external memory and load them whenever the functions are required. This capability reduces the size of the device because it allows multiple applications on a single device—saving the board space and reducing the power consumption.

Intel simplifies the time-intensive task of partial reconfiguration by building this capability on top of the proven incremental compile and design flow in the Intel Quartus Prime design software. With the Intel solution, you do not need to know all the intricate device architecture details to perform a partial reconfiguration.

Partial reconfiguration is supported through the FPP x16 configuration interface. You can seamlessly use partial reconfiguration in tandem with dynamic reconfiguration to enable simultaneous partial reconfiguration of both the device core and transceivers.

## Enhanced Configuration and Configuration via Protocol

Cyclone V devices support 1.8 V, 2.5 V, 3.0 V, and 3.3 V programming voltages and several configuration schemes.

**Table 24. Configuration Schemes and Features Supported by Cyclone V Devices**

Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security	Partial Reconfiguration <sup>(18)</sup>	Remote System Update
AS through the EPCS and EPCQ serial configuration device	1 bit, 4 bits	100	—	Yes	Yes	—	Yes
PS through CPLD or external microcontroller	1 bit	125	125	Yes	Yes	—	—
FPP	8 bits	125	—	Yes	Yes	—	Parallel flash loader
	16 bits	125	—	Yes	Yes	Yes	
CvP (PCIe)	x1, x2, and x4 lanes	—	—	Yes	Yes	Yes	—
JTAG	1 bit	33	33	—	—	—	—

Instead of using an external flash or ROM, you can configure the Cyclone V devices through PCIe using CvP. The CvP mode offers the fastest configuration rate and flexibility with the easy-to-use PCIe hard IP block interface. The Cyclone V CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

### Related Information

Provides more information about CvP.

<sup>(18)</sup> The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Intel sales representatives.

## Power Management

Leveraging the FPGA architectural features, process technology advancements, and transceivers that are designed for power efficiency, the Cyclone V devices consume less power than previous generation Cyclone FPGAs:

- Total device core power consumption—less by up to 40%.
- Transceiver channel power consumption—less by up to 50%.

Additionally, Cyclone V devices contain several hard IP blocks that reduce logic resources and deliver substantial power savings of up to 25% less power than equivalent soft implementations.
