Understanding [Embedded - FPGAs (Field Programmable Gate Array)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	113560
Number of Logic Elements/Cells	301000
Total RAM Bits	14251008
Number of I/O	480
Number of Gates	-
Voltage - Supply	1.07V ~ 1.13V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	896-BGA
Supplier Device Package	896-FBGA (31x31)

Summary of Cyclone V Features

Table 2. **Summary of Features for Cyclone V Devices**

Feature	Description	
Technology	• TSMC's 28-nm low-power (28LP) process technology • 1.1 V core voltage	
Packaging	• Wirebond low-halogen packages • Multiple device densities with compatible package footprints for seamless migration between different device densities • RoHS-compliant and leaded[1] options	
High-performance FPGA fabric	Enhanced 8-input ALM with four registers	
Internal memory blocks	• M10K—10-kilobits (Kb) memory blocks with soft error correction code (ECC) • Memory logic array block (MLAB)—640-bit distributed LUTRAM where you can use up to 25% of the ALMs as MLAB memory	
Embedded Hard IP blocks	Variable-precision DSP	• Native support for up to three signal processing precision levels (three 9 x 9, two 18 x 18, or one 27 x 27 multiplier) in the same variable-precision DSP block • 64-bit accumulator and cascade • Embedded internal coefficient memory • Preadder/subtractor for improved efficiency
	Memory controller	DDR3, DDR2, and LPDDR2 with 16 and 32 bit ECC support
	Embedded transceiver I/O	PCI Express* (PCIe*) Gen2 and Gen1 (x1, x2, or x4) hard IP with multifunction support, endpoint, and root port
Clock networks	• Up to 550 MHz global clock network • Global, quadrant, and peripheral clock networks • Clock networks that are not used can be powered down to reduce dynamic power	
Phase-locked loops (PLLs)	• Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) • Integer mode and fractional mode	
FPGA General-purpose I/Os (GPIOs)	• 875 megabits per second (Mbps) LVDS receiver and 840 Mbps LVDS transmitter • 400 MHz/800 Mbps external memory interface • On-chip termination (OCT) • 3.3 V support with up to 16 mA drive strength	
Low-power high-speed serial interface	• 614 Mbps to 6.144 Gbps integrated transceiver speed • Transmit pre-emphasis and receiver equalization • Dynamic partial reconfiguration of individual channels	
HPS (Cyclone V SE, SX, and ST devices only)	• Single or dual-core Arm Cortex-A9 MPCore processor-up to 925 MHz maximum frequency with support for symmetric and asymmetric multiprocessing • Interface peripherals—10/100/1000 Ethernet media access control (EMAC), USB 2.0 On-The-GO (OTG) controller, quad serial peripheral interface (QSPI) flash controller, NAND flash controller, Secure Digital/MultiMediaCard (SD/MMC) controller, UART, controller area network (CAN), serial peripheral interface (SPI), I^2C interface, and up to 85 HPS GPIO interfaces • System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers • On-chip RAM and boot ROM

Feature	Description
	• HPS–FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa • FPGA-to-HPS SDRAM controller subsystem—provides a configurable interface to the multiport front end (MPFE) of the HPS SDRAM controller • Arm CoreSight™ JTAG debug access port, trace port, and on-chip trace storage
Configuration	• Tamper protection—comprehensive design protection to protect your valuable IP investments • Enhanced advanced encryption standard (AES) design security features • CvP • Dynamic reconfiguration of the FPGA • Active serial (AS) x1 and x4, passive serial (PS), JTAG, and fast passive parallel (FPP) x8 and x16 configuration options • Internal scrubbing [(2)] • Partial reconfiguration [(3)]

Cyclone V Device Variants and Packages

Table 3.   Device Variants for the Cyclone V Device Family

Variant	Description
Cyclone V E	Optimized for the lowest system cost and power requirement for a wide spectrum of general logic and DSP applications
Cyclone V GX	Optimized for the lowest cost and power requirement for 614 Mbps to 3.125 Gbps transceiver applications
Cyclone V GT	The FPGA industry's lowest cost and lowest power requirement for 6.144 Gbps transceiver applications
Cyclone V SE	SoC with integrated Arm-based HPS
Cyclone V SX	SoC with integrated Arm-based HPS and 3.125 Gbps transceivers
Cyclone V ST	SoC with integrated Arm-based HPS and 6.144 Gbps transceivers

Cyclone V E

This section provides the available options, maximum resource counts, and package plan for the Cyclone V E devices.

    Lists the embedded memory capacity for each device.

Variable-Precision DSP Block

Cyclone V devices feature a variable-precision DSP block that supports these features:

*   Configurable to support signal processing precisions ranging from 9 x 9, 18 x 18 and 27 x 27 bits natively

*   A 64-bit accumulator

*   A hard preadder that is available in both 18- and 27-bit modes

*   Cascaded output adders for efficient systolic finite impulse response (FIR) filters

*   Internal coefficient register banks, 8 deep, for each multiplier in 18- or 27-bit mode

*   Fully independent multiplier operation

*   A second accumulator feedback register to accommodate complex multiply-accumulate functions

*   Fully independent Efficient support for single-precision floating point arithmetic

*   The inferability of all modes by the Intel Quartus Prime design software

**Table 16. Variable-Precision DSP Block Configurations for Cyclone V Devices**

Usage Example	Multiplier Size (Bit)	DSP Block Resource
Low precision fixed point for video applications	Three 9 x 9	1
Medium precision fixed point in FIR filters	Two 18 x 18	1
FIR filters and general DSP usage	Two 18 x 18 with accumulate	1
High precision fixed- or floating-point implementations	One 27 x 27 with accumulate	1

You can configure each DSP block during compilation as independent three 9 x 9, two 18 x 18, or one 27 x 27 multipliers. With a dedicated 64 bit cascade bus, you can cascade multiple variable-precision DSP blocks to implement even higher precision DSP functions efficiently.

Table 17. Number of Multipliers in Cyclone V Devices

The table lists the variable-precision DSP resources by bit precision for each Cyclone V device.

Variant	Member Code	Variable-precision DSP Block	Independent Input and Output Multiplications Operator			18 x 18 Multiplier Adder Mode	18 x 18 Multiplier Adder Summed with 36 bit Input
			9 x 9 Multiplier	18 x 18 Multiplier	27 x 27 Multiplier

Embedded Memory Configurations

Table 19. **Supported Embedded Memory Block Configurations for Cyclone V Devices**

This table lists the maximum configurations supported for the embedded memory blocks. The information is applicable only to the single-port RAM and ROM modes.

Memory Block	Depth (bits)	Programmable Width
MLAB	32	x16, x18, or x20
M10K	256	x40 or x32
	512	x20 or x16
	1K	x10 or x8
	2K	x5 or x4
	4K	x2
	8K	x1

Clock Networks and PLL Clock Sources

550 MHz Cyclone V devices have 16 global clock networks capable of up to operation. The clock network architecture is based on Intel's global, quadrant, and peripheral clock structure. This clock structure is supported by dedicated clock input pins and fractional PLLs.

Note: To reduce power consumption, the Intel Quartus Prime software identifies all unused sections of the clock network and powers them down.

PCIe Gen1 and Gen2 Hard IP

Cyclone V GX, GT, SX, and ST devices contain PCIe hard IP that is designed for performance and ease-of-use. The PCIe hard IP consists of the MAC, data link, and transaction layers.

The PCIe hard IP supports PCIe Gen2 and Gen1 end point and root port for up to x4 lane configuration. The PCIe Gen2 x4 support is PCIe-compatible.

The PCIe endpoint support includes multifunction support for up to eight functions, as shown in the following figure. The integrated multifunction support reduces the FPGA logic requirements by up to 20,000 LEs for PCIe designs that require multiple peripherals.

Figure 9.   PCIe Multifunction for Cyclone V Devices
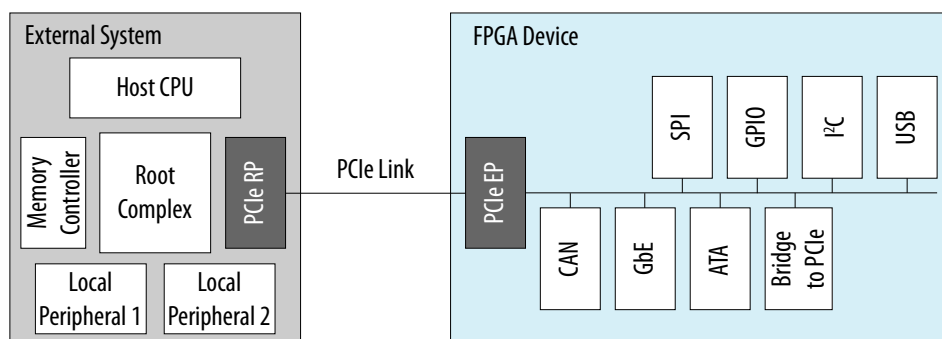

The Cyclone V PCIe hard IP operates independently from the core logic. This independent operation allows the PCIe link to wake up and complete link training in less than 100 ms while the Cyclone V device completes loading the programming file for the rest of the device.

In addition, the PCIe hard IP in the Cyclone V device provides improved end-to-end datapath protection using ECC.

External Memory Interface

This section provides an overview of the external memory interface in Cyclone V devices.

Hard and Soft Memory Controllers

Cyclone V devices support up to two hard memory controllers for DDR3, DDR2, and LPDDR2 SDRAM devices. Each controller supports 8 to 32 bit components of up to 4 gigabits (Gb) in density with two chip selects and optional ECC. For the Cyclone V SoC devices, an additional hard memory controller in the HPS supports DDR3, DDR2, and LPDDR2 SDRAM devices.

All Cyclone V devices support soft memory controllers for DDR3, DDR2, and LPDDR2 SDRAM devices for maximum flexibility.

External Memory Performance

Table 20. **External Memory Interface Performance in Cyclone V Devices**

The maximum and minimum operating frequencies depend on the memory interface standards and the supported delay-locked loop (DLL) frequency listed in the device datasheet.

Interface	Voltage (V)	Maximum Frequency (MHz)		Minimum Frequency (MHz)
		Hard Controller	**Soft Controller**	
DDR3 SDRAM	1.5	400	303	303
	1.35	400	303	303
DDR2 SDRAM	1.8	400	300	167
LPDDR2 SDRAM	1.2	333	300	167

Low-Power Serial Transceivers

Cyclone V devices deliver the industry's lowest power 6.144 Gbps transceivers at an estimated 88 mW maximum power consumption per channel. Cyclone V transceivers are designed to be compliant with a wide range of protocols and data rates.

Transceiver Channels

The transceivers are positioned on the left outer edge of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

Figure 10.   Device Chip Overview for Cyclone V GX and GT Devices

The figure shows a Cyclone V FPGA with transceivers. Different Cyclone V devices may have a different floorplans than the one shown here.
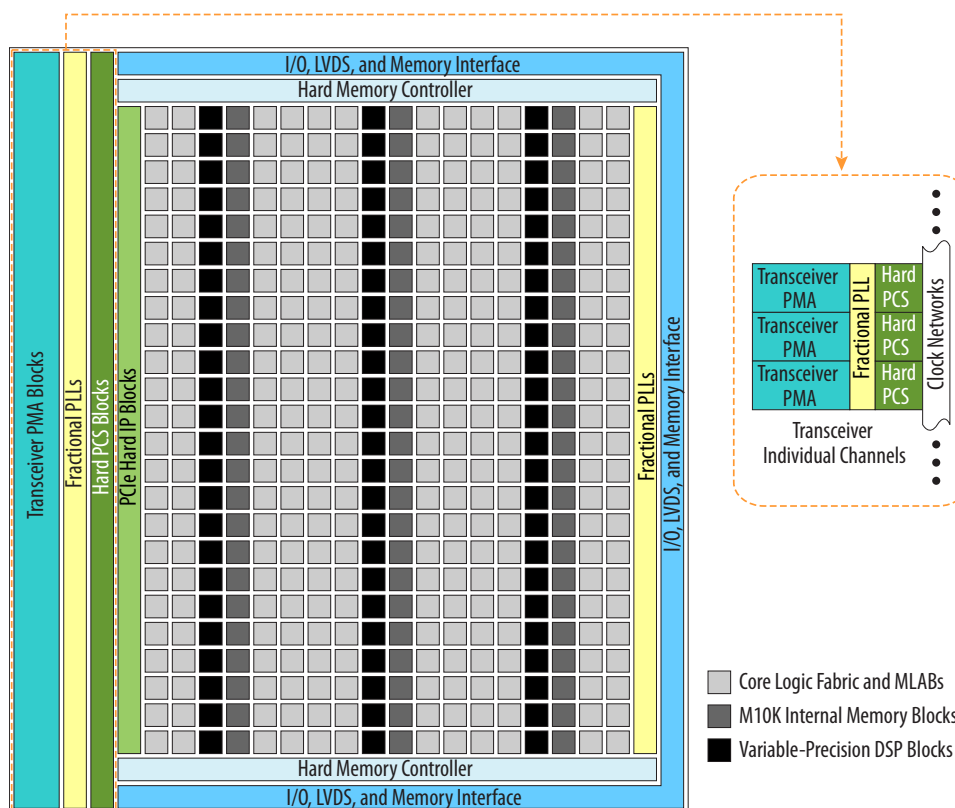

PMA Features

To prevent core and I/O noise from coupling into the transceivers, the PMA block is isolated from the rest of the chip—ensuring optimal signal integrity. For the transceivers, you can use the channel PLL of an unused receiver PMA as an additional transmit PLL.

Table 22.   PMA Features of the Transceivers in Cyclone V Devices

Features	Capability
Backplane support	Driving capability up to 6.144 Gbps
PLL-based clock recovery	Superior jitter tolerance
Programmable deserialization and word alignment	Flexible deserialization width and configurable word alignment pattern
Equalization and pre-emphasis	• Up to 14.37 dB of pre-emphasis and up to 4.7 dB of equalization • No decision feedback equalizer (DFE)
Ring oscillator transmit PLLs	614 Mbps to 6.144 Gbps
Input reference clock range	20 MHz to 400 MHz
Transceiver dynamic reconfiguration	Allows the reconfiguration of a single channel without affecting the operation of other channels

PCS Features

The Cyclone V core logic connects to the PCS through an 8, 10, 16, 20, 32, or 40 bit interface, depending on the transceiver data rate and protocol. Cyclone V devices contain PCS hard IP to support PCIe Gen1 and Gen2, Gbps Ethernet (GbE), Serial RapidIO® (SRIO), and Common Public Radio Interface (CPRI).

Most of the standard and proprietary protocols from 614 Mbps to 6.144 Gbps are supported.

Table 23.   Transceiver PCS Features for Cyclone V Devices

| PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
3-Gbps and 6-Gbps Basic	0.614 to 6.144	• Phase compensation FIFO • Byte serializer • 8B/10B encoder • Transmitter bit-slip	• Word aligner • Deskew FIFO • Rate-match FIFO • 8B/10B decoder • Byte deserializer • Byte ordering • Receiver phase compensation FIFO
PCIe Gen1 (x1, x2, x4) PCIe Gen2 (x1, x2, x4)[12]	2.5 and 5.0	• Dedicated PCIe PHY IP core • PIPE 2.0 interface to the core logic	• Dedicated PCIe PHY IP core • PIPE 2.0 interface to the core logic
GbE	1.25	• Custom PHY IP core with preset feature • GbE transmitter synchronization state machine	• Custom PHY IP core with preset feature • GbE receiver synchronization state machine
XAUI [13] HiGig	3.125 3.75	• Dedicated XAUI PHY IP core • XAUI synchronization state machine for bonding four channels	• Dedicated XAUI PHY IP core • XAUI synchronization state machine for realigning four channels
SRIO 1.3 and 2.1	1.25 to 3.125	• Custom PHY IP core with preset feature • SRIO version 2.1-compliant x2 and x4 channel bonding	• Custom PHY IP core with preset feature • SRIO version 2.1-compliant x2 and x4 deskew state machine
SDI, SD/HD, and 3G-SDI JESD204A	0.27[14], 1.485, and 2.97 0.3125[15] to 3.125	Custom PHY IP core with preset feature	Custom PHY IP core with preset feature

continued...

---

[12] PCIe Gen2 is supported for Cyclone V GT and ST devices. The PCIe Gen2 x4 support is PCIe-compatible.

[13] XAUI is supported through the soft PCS.

[14] The 0.27-Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.

[15] The 0.3125-Gbps data rate is supported using oversampling user logic that you must implement in the FPGA fabric.

PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
Serial ATA Gen1 and Gen2	1.5 and 3.0	• Custom PHY IP core with preset feature • Electrical idle	• Custom PHY IP core with preset feature • Signal detect • Wider spread of asynchronous SSC
CPRI 4.1[16]	0.6144 to 6.144	• Dedicated deterministic latency PHY IP core • Transmitter (TX) manual bit-slip mode	• Dedicated deterministic latency PHY IP core • Receiver (RX) deterministic latency state machine
OBSAI RP3	0.768 to 3.072		
V-by-One HS	Up to 3.75	Custom PHY IP core	• Custom PHY IP core • Wider spread of asynchronous SSC
DisplayPort 1.2[17]	1.62 and 2.7		

SoC with HPS

Each SoC combines an FPGA fabric and an HPS in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor

- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard

- Extends the product life and revenue through in-field hardware and software updates

HPS Features

The HPS consists of a dual-core Arm Cortex-A9 MPCore processor, a rich set of peripherals, and a shared multiport SDRAM memory controller, as shown in the following figure.

---

[16] High-voltage output mode (1000-BASE-CX) is not supported.

[17] Pending characterization.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA®) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.

- HPS-to-FPGA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.

- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to slaves in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features. The SDRAM controller subsystem supports DDR2, DDR3, or LPDDR2 devices up to 4 Gb in density operating at up to 400 MHz (800 Mbps data rate).

FPGA Configuration and Processor Booting

The FPGA fabric and HPS in the SoC are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power, or shut down the entire FPGA fabric to reduce total system power.

You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.

- You can power up both the HPS and the FPGA fabric together, configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

Apart from lowering cost and power consumption, partial reconfiguration increases the effective logic density of the device because placing device functions that do not operate simultaneously is not necessary. Instead, you can store these functions in external memory and load them whenever the functions are required. This capability reduces the size of the device because it allows multiple applications on a single device—saving the board space and reducing the power consumption.

Intel simplifies the time-intensive task of partial reconfiguration by building this capability on top of the proven incremental compile and design flow in the Intel Quartus Prime design software. With the Intel solution, you do not need to know all the intricate device architecture details to perform a partial reconfiguration.

Partial reconfiguration is supported through the FPP x16 configuration interface. You can seamlessly use partial reconfiguration in tandem with dynamic reconfiguration to enable simultaneous partial reconfiguration of both the device core and transceivers.

Enhanced Configuration and Configuration via Protocol

Cyclone V devices support 1.8 V, 2.5 V, 3.0 V, and 3.3 V programming voltages and several configuration schemes.

Table 24.   Configuration Schemes and Features Supported by Cyclone V Devices

| Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security	Partial Reconfiguration[18]	Remote System Update
AS through the EPCS and EPCQ serial configuration device	1 bit, 4 bits	100	—	Yes	Yes	—	Yes
PS through CPLD or external microcontroller	1 bit	125	125	Yes	Yes	—	—
FPP	8 bits	125	—	Yes	Yes	—	Parallel flash loader
	16 bits	125	—	Yes	Yes	Yes	
CvP (PCIe)	x1, x2, and x4 lanes	—	—	Yes	Yes	Yes	—
JTAG	1 bit	33	33	—	—	—	—

Instead of using an external flash or ROM, you can configure the Cyclone V devices through PCIe using CvP. The CvP mode offers the fastest configuration rate and flexibility with the easy-to-use PCIe hard IP block interface. The Cyclone V CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

    Provides more information about CvP.

---

[18] The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Intel sales representatives.

Date	Version	Changes
		• Updated MLAB RAM Bit (Kb) in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C3: Updated from 181 to 182 — Cyclone V GX C4: Updated from 295 to 424 • Updated Total RAM Bit (Kb) in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C3: Updated from 1,531 to 1,532 — Cyclone V GX C4: Updated from 2,795 to 2,924 • Updated MLAB Block count in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C4: Updated from 472 to 678 — Cyclone V GX C5: Updated from 679 to 678
March 2015	2015.03.31	• Added internal scrubbing feature under configuration in Summary of Features for Cyclone V Devices table. • Added optional suffix "SC: Internal scrubbing support" to the following diagrams: — Sample Ordering Code and Available Options for Cyclone V E Devices — Sample Ordering Code and Available Options for Cyclone V GX Devices — Sample Ordering Code and Available Options for Cyclone V SE Devices — Sample Ordering Code and Available Options for Cyclone V SX Devices
January 2015	2015.01.23	• Updated Sample Ordering Code and Available Options for Cyclone V ST Devices figure because Cyclone V ST devices are only available in I temperature grade and –7 speed grade. — Operating Temperature: Removed C and A temperature grades — FPGA Fabric Speed Grade: Removed –6 and –8 speed grades • Updated the transceiver specification for Cyclone V ST from 5 Gbps to 6.144 Gbps: — Device Variants for the Cyclone V Device Family table — Sample Ordering Code and Available Options for Cyclone V ST Devices figure — Maximum Resource Counts for Cyclone V ST Devices • Updated Maximum Resource Counts for Cyclone V GX Devices table for Cyclone V GX G3 devices. — Logic elements (LE) (K): Updated from 35.7 to 35.5 — Variable-precision DSP block: Updated from 51 to 57 — 18 x 18 multiplier: Updated from 102 to 114 • Updated Number of Multipliers in Cyclone V Devices table for Cyclone V GX G3 devices. — Variableprecision DSP Block: Updated from 51 to 57 — 9 x 9 Multiplier: Updated from 153 to 171 — 18 x 18 Multiplier: Updated from 102 to 114 — 27 x 27 Multiplier: Updated from 51 to 57 — 18 x 18 Multiplier Adder Mode: Updated from 51 to 57 — 18 x 18 Multiplier Adder Summed with 36 bit Input: Updated from 51 to 57 • Updated Embedded Memory Capacity and Distribution in Cyclone V Devices table for Cyclone V GX G3 devices. — M10K block: Updated from 119 to 135 — M10K RAM bit (Kb): Updated from 1,190 to 1,350 — MLAB block: Updated from 255 to 291 — MLAB RAM bit (Kb): Updated from 159 to 181 — Total RAM bit (Kb): Updated from 1,349 to 1,531
October 2014	2014.10.06	Added a footnote to the "Transceiver PCS Features for Cyclone V Devices" table to show that PCIe Gen2 is supported for Cyclone V GT and ST devices.

continued...

Date	Version	Changes
July 2014	2014.07.07	Updated the I/O vertical migration figure to clarify the migration capability of Cyclone V SE and SX devices.
December 2013	2013.12.26	• Corrected single or dual-core ARM Cortex-A9 MPCore processor-up to 925 MHz from 800 MHz. • Removed "Preliminary" texts from Ordering Code figures, Maximum Resources, Package Plan and I/O Vertical Migration tables. • Removed the note "The number of GPIOs does not include transceiver I/Os. In the Quartus II software, the number of user I/Os includes transceiver I/Os." for GPIOs in the Maximum Resource Counts table for Cyclone V E and SE. • Added link to Altera Product Selector for each device variant. • Updated Embedded Hard IPs for Cyclone V GT devices to indicate Maximum 2 hard PCIe and 2 hard memory controllers. • Added leaded package options. • Removed the note "The number of PLLs includes general-purpose fractional PLLs and transceiver fractional PLLs." for all PLLs in the Maximum Resource Counts table. • Corrected max LVDS counts for transmitter and receiver for Cyclone V E A5 device from 84 to 60. • Corrected max LVDS counts for transmitter and receiver for Cyclone V E A9 device from 140 to 120. • Corrected variable-precision DSP block, 27 x 27 multiplier, 18 x 18 multiplier adder mode and 18 x 18 multiplier adder summed with 36 bit input for Cyclone V SE devices from 58 to 84. • Corrected 18 x 18 multiplier for Cyclone V SE devices from 116 to 168. • Corrected 9 x 9 multiplier for Cyclone V SE devices from 174 to 252. • Corrected LVDS transmitter for Cyclone V SE A2 and A4 as well as SX C2 and C4 devices from 31 to 32. • Corrected LVDS receiver for Cyclone V SE A2 and A4 as well as SX C2 and C4 devices from 35 to 37. • Corrected transceiver speed grade for Cyclone V ST devices ordering code from 4 to 5. • Updated the DDR3 SDRAM for the maximum frequency's soft controller and the minimum frequency from 300 to 303 for voltage 1.35V. • Added links to Altera's External Memory Spec Estimator tool to the topics listing the external memory interface performance. • Corrected XAUI is supported through the soft PCS in the PCS features for Cyclone V. • Added decompression support for the CvP configuration mode.
May 2013	2013.05.06	• Added link to the known document issues in the Knowledge Base. • Moved all links to the Related Information section of respective topics for easy reference. • Corrected the title to the PCIe hard IP topic. Cyclone V devices support only PCIe Gen1 and Gen2. • Updated Supporting Feature in Table 1 of Increased bandwidth capacity to '6.144 Gbps'. • Updated Description in Table 2 of Low-power high-speed serial interface to '6.144 Gbps'. • Updated Description in Table 3 of Cyclone V GT to '6.144 Gbps'. • Updated the M386 package to M383 for Figure 1, Figure 2 and Figure 3. • Updated Figure 2 and Figure 3 for Transceiver Count by adding 'F : 4'. • Updated LVDS in the Maximum Resource Counts tables to include Transmitter and Receiver values. • Updated the package plan with M383 for the Cyclone V E device. • Removed the M301 and M383 packages from the Cyclone V GX C4 device. • Updated the GPIO count to '129' for the M301 package of the Cyclone V GX C5 device. • Updated 5 Gbps to '6.144 Gbps' forCyclone V GT device.
