Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	29080
Number of Logic Elements/Cells	77000
Total RAM Bits	5001216
Number of I/O	129
Number of Gates	-
Voltage - Supply	1.07V ~ 1.13V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	301-TFBGA
Supplier Device Package	301-MBGA (11x11)

Cyclone V Device Overview

The Cyclone® V devices are designed to simultaneously accommodate the shrinking power consumption, cost, and time-to-market requirements; and the increasing bandwidth requirements for high-volume and cost-sensitive applications.

Enhanced with integrated transceivers and hard memory controllers, the Cyclone V devices are suitable for applications in the industrial, wireless and wireline, military, and automotive markets.

Key Advantages of Cyclone V Devices

Table 1. Key Advantages of the Cyclone V Device Family

Advantage	Supporting Feature
Lower power consumption	<ul style="list-style-type: none"> Built on TSMC's 28 nm low-power (28LP) process technology and includes an abundance of hard intellectual property (IP) blocks Up to 40% lower power consumption than the previous generation device
Improved logic integration and differentiation capabilities	<ul style="list-style-type: none"> 8-input adaptive logic module (ALM) Up to 13.59 megabits (Mb) of embedded memory Variable-precision digital signal processing (DSP) blocks
Increased bandwidth capacity	<ul style="list-style-type: none"> 3.125 gigabits per second (Gbps) and 6.144 Gbps transceivers Hard memory controllers
Hard processor system (HPS) with integrated Arm* Cortex*-A9 MPCore* processor	<ul style="list-style-type: none"> Tight integration of a dual-core Arm Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Cyclone V system-on-a-chip (SoC) Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Lowest system cost	<ul style="list-style-type: none"> Requires only two core voltages to operate Available in low-cost wirebond packaging Includes innovative features such as Configuration via Protocol (CvP) and partial reconfiguration

Summary of Cyclone V Features

Table 2. Summary of Features for Cyclone V Devices

Feature	Description	
Technology	<ul style="list-style-type: none"> TSMC's 28-nm low-power (28LP) process technology 1.1 V core voltage 	
Packaging	<ul style="list-style-type: none"> Wirebond low-halogen packages Multiple device densities with compatible package footprints for seamless migration between different device densities RoHS-compliant and leaded⁽¹⁾ options 	
High-performance FPGA fabric	Enhanced 8-input ALM with four registers	
Internal memory blocks	<ul style="list-style-type: none"> M10K—10-kilobits (Kb) memory blocks with soft error correction code (ECC) Memory logic array block (MLAB)—640-bit distributed LUTRAM where you can use up to 25% of the ALMs as MLAB memory 	
Embedded Hard IP blocks	Variable-precision DSP	<ul style="list-style-type: none"> Native support for up to three signal processing precision levels (three 9 x 9, two 18 x 18, or one 27 x 27 multiplier) in the same variable-precision DSP block 64-bit accumulator and cascade Embedded internal coefficient memory Padder/subtractor for improved efficiency
	Memory controller	DDR3, DDR2, and LPDDR2 with 16 and 32 bit ECC support
	Embedded transceiver I/O	PCI Express* (PCIe*) Gen2 and Gen1 (x1, x2, or x4) hard IP with multifunction support, endpoint, and root port
Clock networks	<ul style="list-style-type: none"> Up to 550 MHz global clock network Global, quadrant, and peripheral clock networks Clock networks that are not used can be powered down to reduce dynamic power 	
Phase-locked loops (PLLs)	<ul style="list-style-type: none"> Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) Integer mode and fractional mode 	
FPGA General-purpose I/Os (GPIOs)	<ul style="list-style-type: none"> 875 megabits per second (Mbps) LVDS receiver and 840 Mbps LVDS transmitter 400 MHz/800 Mbps external memory interface On-chip termination (OCT) 3.3 V support with up to 16 mA drive strength 	
Low-power high-speed serial interface	<ul style="list-style-type: none"> 614 Mbps to 6.144 Gbps integrated transceiver speed Transmit pre-emphasis and receiver equalization Dynamic partial reconfiguration of individual channels 	
HPS (Cyclone V SE, SX, and ST devices only)	<ul style="list-style-type: none"> Single or dual-core Arm Cortex-A9 MPCore processor-up to 925 MHz maximum frequency with support for symmetric and asymmetric multiprocessing Interface peripherals—10/100/1000 Ethernet media access control (EMAC), USB 2.0 On-The-Go (OTG) controller, quad serial peripheral interface (QSPI) flash controller, NAND flash controller, Secure Digital/MultiMediaCard (SD/MMC) controller, UART, controller area network (CAN), serial peripheral interface (SPI), I²C interface, and up to 85 HPS GPIO interfaces System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers On-chip RAM and boot ROM

Feature	Description
	<ul style="list-style-type: none"> HPS-FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa FPGA-to-HPS SDRAM controller subsystem—provides a configurable interface to the multiport front end (MPFE) of the HPS SDRAM controller Arm CoreSight™ JTAG debug access port, trace port, and on-chip trace storage
Configuration	<ul style="list-style-type: none"> Tamper protection—comprehensive design protection to protect your valuable IP investments Enhanced advanced encryption standard (AES) design security features CvP Dynamic reconfiguration of the FPGA Active serial (AS) x1 and x4, passive serial (PS), JTAG, and fast passive parallel (FPP) x8 and x16 configuration options Internal scrubbing ⁽²⁾ Partial reconfiguration ⁽³⁾

Cyclone V Device Variants and Packages

Table 3. Device Variants for the Cyclone V Device Family

Variant	Description
Cyclone V E	Optimized for the lowest system cost and power requirement for a wide spectrum of general logic and DSP applications
Cyclone V GX	Optimized for the lowest cost and power requirement for 614 Mbps to 3.125 Gbps transceiver applications
Cyclone V GT	The FPGA industry's lowest cost and lowest power requirement for 6.144 Gbps transceiver applications
Cyclone V SE	SoC with integrated Arm-based HPS
Cyclone V SX	SoC with integrated Arm-based HPS and 3.125 Gbps transceivers
Cyclone V ST	SoC with integrated Arm-based HPS and 6.144 Gbps transceivers

Cyclone V E

This section provides the available options, maximum resource counts, and package plan for the Cyclone V E devices.

Related Information

[6.144-Gbps Support Capability in Cyclone V GT Devices, Cyclone V Device Handbook Volume 2: Transceivers](#)

Provides more information about 6 Gbps transceiver channel count.

⁽¹¹⁾ If you require CPRI (at 4.9152 Gbps) and PCIe Gen2 transmit jitter compliance, Intel recommends that you use only up to seven full-duplex transceiver channels for CPRI, and up to six full-duplex channels for PCIe Gen2. The CMU channels are not considered full-duplex channels.

I/O Vertical Migration for Cyclone V Devices

Figure 7. Vertical Migration Capability Across Cyclone V Device Packages and Densities

The arrows indicate the vertical migration paths. The devices included in each vertical migration path are shaded. You can also migrate your design across device densities in the same package option if the devices have the same dedicated pins, configuration pins, and power pins.

Variant	Member Code	Package										
		M301	M383	M484	F256	U324	U484	F484	U672	F672	F896	F1152
Cyclone V E	A2		↕↕↕		↕↕	↕↕	↕↕	↕↕				
	A4		↕↕		↕↕	↕↕	↕↕	↕↕				
	A5		↕↕↕				↕↕	↕↕				
	A7						↕↕	↕↕		↕↕	↕↕	
	A9						↕↕	↕↕		↕↕	↕↕	
Cyclone V GX	C3						↕↕	↕↕		↕↕	↕↕	
	C4	↕↕	↕↕				↕↕	↕↕		↕↕		
	C5	↕↕	↕↕				↕↕	↕↕		↕↕		
	C7						↕↕	↕↕			↕↕	
	C9						↕↕	↕↕		↕↕	↕↕	
Cyclone V GT	D5						↕↕	↕↕		↕↕	↕↕	
	D7						↕↕	↕↕		↕↕	↕↕	
	D9						↕↕	↕↕		↕↕	↕↕	
Cyclone V SE	A2						↕↕		↕↕↕	↕↕↕		
	A4						↕↕		↕↕↕	↕↕↕		
	A5								↕↕↕	↕↕↕	↕↕	
	A6						↕↕		↕↕↕	↕↕↕	↕↕	
Cyclone V SX	C2								↕↕↕	↕↕↕		
	C4								↕↕↕	↕↕↕		
	C5								↕↕↕	↕↕↕	↕↕	
	C6								↕↕↕	↕↕↕	↕↕	
Cyclone V ST	D5										↕↕	
	D6										↕↕	

You can achieve the vertical migration shaded in red if you use only up to 175 GPIOs for the M383 package, and 138 GPIOs for the U672 package. These migration paths are not shown in the Intel Quartus Prime software Pin Migration View.

Note: To verify the pin migration compatibility, use the Pin Migration View window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Cyclone V devices use a 28 nm ALM as the basic building block of the logic fabric.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than previous generations.

Table 16. Variable-Precision DSP Block Configurations for Cyclone V Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resource
Low precision fixed point for video applications	Three 9 x 9	1
Medium precision fixed point in FIR filters	Two 18 x 18	1
FIR filters and general DSP usage	Two 18 x 18 with accumulate	1
High precision fixed- or floating-point implementations	One 27 x 27 with accumulate	1

You can configure each DSP block during compilation as independent three 9 x 9, two 18 x 18, or one 27 x 27 multipliers. With a dedicated 64 bit cascade bus, you can cascade multiple variable-precision DSP blocks to implement even higher precision DSP functions efficiently.

Table 17. Number of Multipliers in Cyclone V Devices

The table lists the variable-precision DSP resources by bit precision for each Cyclone V device.

Variant	Member Code	Variable-precision DSP Block	Independent Input and Output Multiplications Operator			18 x 18 Multiplier Adder Mode	18 x 18 Multiplier Adder Summed with 36 bit Input

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

Types of Embedded Memory

The Cyclone V devices contain two types of memory blocks:

- 10 Kb M10K blocks—blocks of dedicated memory resources. The M10K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Cyclone V devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

Embedded Memory Capacity in Cyclone V Devices

Table 18. Embedded Memory Capacity and Distribution in Cyclone V Devices

Variant	Member Code	M10K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Cyclone V E	A2	176	1,760	314	196	1,956

External Memory Performance

Table 20. External Memory Interface Performance in Cyclone V Devices

The maximum and minimum operating frequencies depend on the memory interface standards and the supported delay-locked loop (DLL) frequency listed in the device datasheet.

Interface	Voltage (V)	Maximum Frequency (MHz)		Minimum Frequency (MHz)
		Hard Controller	Soft Controller	
DDR3 SDRAM	1.5	400	303	303
	1.35	400	303	303
DDR2 SDRAM	1.8	400	300	167
LPDDR2 SDRAM	1.2	333	300	167

Low-Power Serial Transceivers

Cyclone V devices deliver the industry's lowest power 6.144 Gbps transceivers at an estimated 88 mW maximum power consumption per channel. Cyclone V transceivers are designed to be compliant with a wide range of protocols and data rates.

Transceiver Channels

The transceivers are positioned on the left outer edge of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

PCS Features

The Cyclone V core logic connects to the PCS through an 8, 10, 16, 20, 32, or 40 bit interface, depending on the transceiver data rate and protocol. Cyclone V devices contain PCS hard IP to support PCIe Gen1 and Gen2, Gbps Ethernet (GbE), Serial RapidIO® (SRIO), and Common Public Radio Interface (CPRI).

Most of the standard and proprietary protocols from 614 Mbps to 6.144 Gbps are supported.

Table 23. Transceiver PCS Features for Cyclone V Devices

PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature

SoC with HPS

Each SoC combines an FPGA fabric and an HPS in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

HPS Features

The HPS consists of a dual-core Arm Cortex-A9 MPCore processor, a rich set of peripherals, and a shared multiport SDRAM memory controller, as shown in the following figure.

⁽¹⁶⁾ High-voltage output mode (1000-BASE-CX) is not supported.

⁽¹⁷⁾ Pending characterization.

Apart from lowering cost and power consumption, partial reconfiguration increases the effective logic density of the device because placing device functions that do not operate simultaneously is not necessary. Instead, you can store these functions in external memory and load them whenever the functions are required. This capability reduces the size of the device because it allows multiple applications on a single device—saving the board space and reducing the power consumption.

Intel simplifies the time-intensive task of partial reconfiguration by building this capability on top of the proven incremental compile and design flow in the Intel Quartus Prime design software. With the Intel solution, you do not need to know all the intricate device architecture details to perform a partial reconfiguration.

Partial reconfiguration is supported through the FPP x16 configuration interface. You can seamlessly use partial reconfiguration in tandem with dynamic reconfiguration to enable simultaneous partial reconfiguration of both the device core and transceivers.

Enhanced Configuration and Configuration via Protocol

Cyclone V devices support 1.8 V, 2.5 V, 3.0 V, and 3.3 V programming voltages and several configuration schemes.

Table 24. Configuration Schemes and Features Supported by Cyclone V Devices

Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security	Partial Reconfiguration ⁽¹⁸⁾	Remote System Update
AS through the EPCS and EPCQ serial configuration device	1 bit, 4 bits	100	—	Yes	Yes	—	Yes
PS through CPLD or external microcontroller	1 bit	125	125	Yes	Yes	—	—
FPP	8 bits	125	—	Yes	Yes	—	Parallel flash loader
	16 bits	125	—	Yes	Yes	Yes	
CvP (PCIe)	x1, x2, and x4 lanes	—	—	Yes	Yes	Yes	—
JTAG	1 bit	33	33	—	—	—	—

Instead of using an external flash or ROM, you can configure the Cyclone V devices through PCIe using CvP. The CvP mode offers the fastest configuration rate and flexibility with the easy-to-use PCIe hard IP block interface. The Cyclone V CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.
