Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	56480
Number of Logic Elements/Cells	149500
Total RAM Bits	7880704
Number of I/O	240
Number of Gates	-
Voltage - Supply	1.07V ~ 1.13V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/intel/5cgxfc7c7f23c8n

Cyclone V Device Overview

The Cyclone® V devices are designed to simultaneously accommodate the shrinking power consumption, cost, and time-to-market requirements; and the increasing bandwidth requirements for high-volume and cost-sensitive applications.

Enhanced with integrated transceivers and hard memory controllers, the Cyclone V devices are suitable for applications in the industrial, wireless and wireline, military, and automotive markets.

Related Information

Cyclone V Device Handbook: Known Issues
Lists the planned updates to the Cyclone V Device Handbook chapters.

Key Advantages of Cyclone V Devices

Table 1. Key Advantages of the Cyclone V Device Family

Advantage	Supporting Feature
Lower power consumption	• Built on TSMC's 28 nm low-power (28LP) process technology and includes an abundance of hard intellectual property (IP) blocks • Up to 40% lower power consumption than the previous generation device
Improved logic integration and differentiation capabilities	• 8-input adaptive logic module (ALM) • Up to 13.59 megabits (Mb) of embedded memory • Variable-precision digital signal processing (DSP) blocks
Increased bandwidth capacity	• 3.125 gigabits per second (Gbps) and 6.144 Gbps transceivers • Hard memory controllers
Hard processor system (HPS) with integrated Arm* Cortex*-A9 MPCore* processor	• Tight integration of a dual-core Arm Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Cyclone V system-on-a-chip (SoC) • Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric
Lowest system cost	• Requires only two core voltages to operate • Available in low-cost wirebond packaging • Includes innovative features such as Configuration via Protocol (CvP) and partial reconfiguration

Available Options

6.144-Gbps Support Capability in Cyclone V GT Devices, Cyclone V Device Handbook Volume 2: Transceivers
Provides more information about 6 Gbps transceiver channel count.

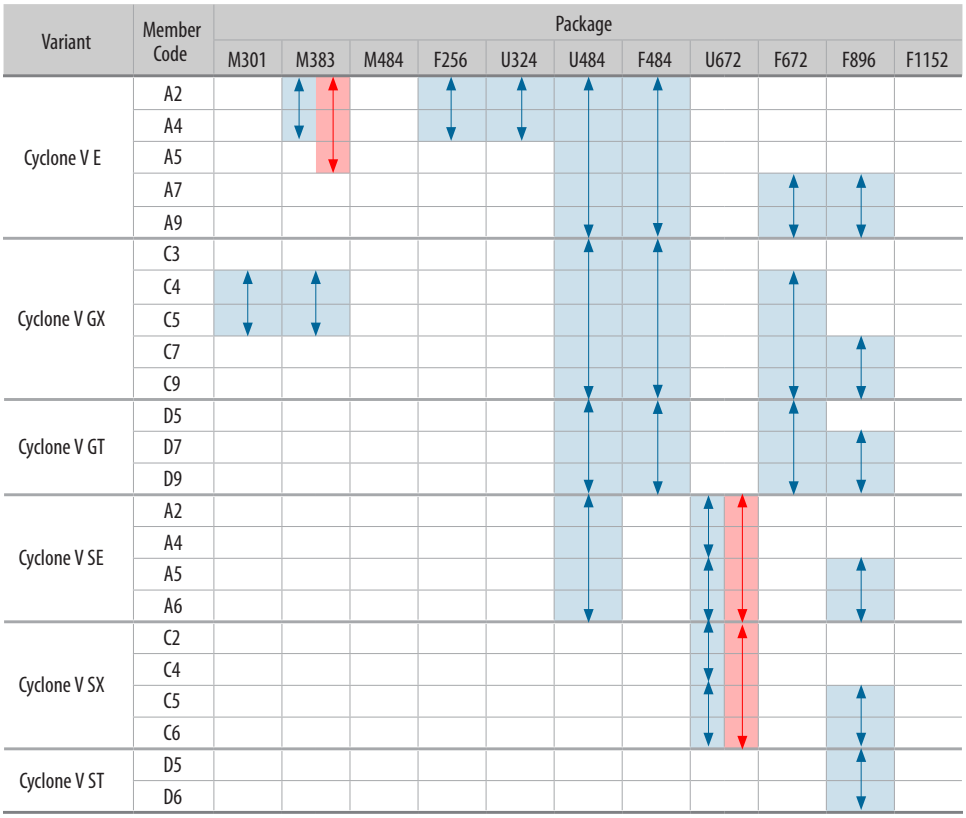
(11) If you require CPRI (at 4.9152 Gbps) and PCIe Gen2 transmit jitter compliance, Intel recommends that you use only up to seven full-duplex transceiver channels for CPRI, and up to six full-duplex channels for PCIe Gen2. The CMU channels are not considered full-duplex channels.

I/O Vertical Migration for Cyclone V Devices

Figure 7. Vertical Migration Capability Across Cyclone V Device Packages and Densities

The arrows indicate the vertical migration paths. The devices included in each vertical migration path are shaded. You can also migrate your design across device densities in the same package option if the devices have the same dedicated pins, configuration pins, and power pins.



You can achieve the vertical migration shaded in red if you use only up to 175 GPIOs for the M383 package, and 138 GPIOs for the U672 package. These migration paths are not shown in the Intel Quartus Prime software Pin Migration View.

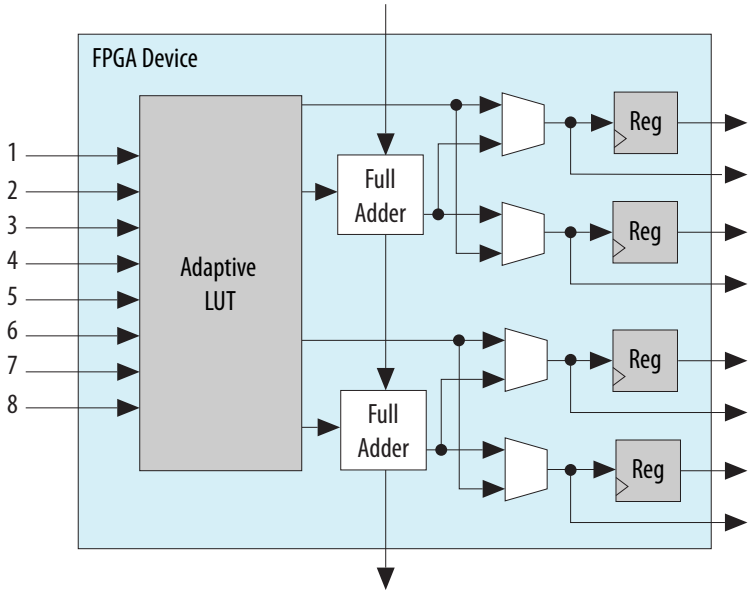
Note: To verify the pin migration compatibility, use the Pin Migration View window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Cyclone V devices use a 28 nm ALM as the basic building block of the logic fabric.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than previous generations.

Figure 8. ALM for Cyclone V Devices



You can configure up to 25% of the ALMs in the Cyclone V devices as distributed memory using MLABs.

Embedded Memory Capacity in Cyclone V Devices on page 21
Lists the embedded memory capacity for each device.

Variable-Precision DSP Block

Cyclone V devices feature a variable-precision DSP block that supports these features:

- Configurable to support signal processing precisions ranging from 9 x 9, 18 x 18 and 27 x 27 bits natively
- A 64-bit accumulator
- A hard preadder that is available in both 18- and 27-bit modes
- Cascaded output adders for efficient systolic finite impulse response (FIR) filters
- Internal coefficient register banks, 8 deep, for each multiplier in 18- or 27-bit mode
- Fully independent multiplier operation
- A second accumulator feedback register to accommodate complex multiply-accumulate functions
- Fully independent Efficient support for single-precision floating point arithmetic
- The inferability of all modes by the Intel Quartus Prime design software

External Memory Performance

Table 20. External Memory Interface Performance in Cyclone V Devices

The maximum and minimum operating frequencies depend on the memory interface standards and the supported delay-locked loop (DLL) frequency listed in the device datasheet.

Interface	Voltage (V)	Maximum Frequency (MHz)		Minimum Frequency (MHz)
		Hard Controller	Soft Controller	
DDR3 SDRAM	1.5	400	303	303
	1.35	400	303	303
DDR2 SDRAM	1.8	400	300	167
LPDDR2 SDRAM	1.2	333	300	167

Low-Power Serial Transceivers

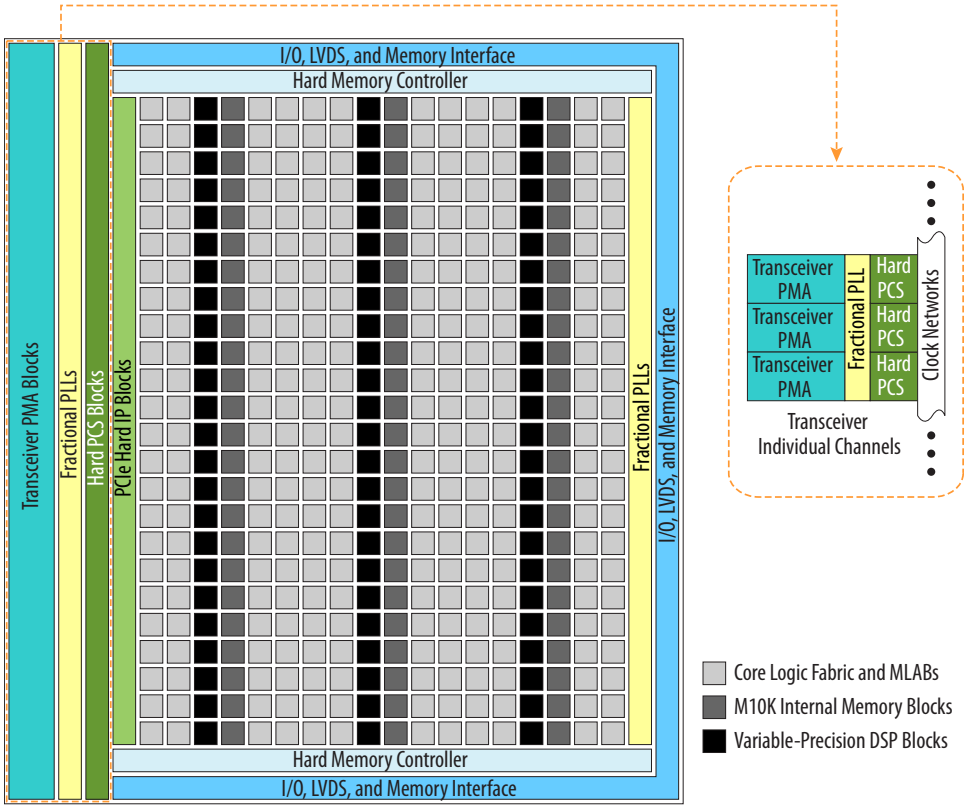
Cyclone V devices deliver the industry’s lowest power 6.144 Gbps transceivers at an estimated 88 mW maximum power consumption per channel. Cyclone V transceivers are designed to be compliant with a wide range of protocols and data rates.

Transceiver Channels

The transceivers are positioned on the left outer edge of the device. The transceiver channels consist of the physical medium attachment (PMA), physical coding sublayer (PCS), and clock networks.

Figure 10. Device Chip Overview for Cyclone V GX and GT Devices

The figure shows a Cyclone V FPGA with transceivers. Different Cyclone V devices may have a different floorplans than the one shown here.



PMA Features

To prevent core and I/O noise from coupling into the transceivers, the PMA block is isolated from the rest of the chip—ensuring optimal signal integrity. For the transceivers, you can use the channel PLL of an unused receiver PMA as an additional transmit PLL.

Table 22. PMA Features of the Transceivers in Cyclone V Devices

Features	Capability
Backplane support	Driving capability up to 6.144 Gbps
PLL-based clock recovery	Superior jitter tolerance
Programmable deserialization and word alignment	Flexible deserialization width and configurable word alignment pattern
Equalization and pre-emphasis	• Up to 14.37 dB of pre-emphasis and up to 4.7 dB of equalization • No decision feedback equalizer (DFE)
Ring oscillator transmit PLLs	614 Mbps to 6.144 Gbps
Input reference clock range	20 MHz to 400 MHz
Transceiver dynamic reconfiguration	Allows the reconfiguration of a single channel without affecting the operation of other channels

PCS Support	Data Rates (Gbps)	Transmitter Data Path Feature	Receiver Data Path Feature
Serial ATA Gen1 and Gen2	1.5 and 3.0	• Custom PHY IP core with preset feature • Electrical idle	• Custom PHY IP core with preset feature • Signal detect • Wider spread of asynchronous SSC
CPRI 4.1(16)	0.6144 to 6.144	• Dedicated deterministic latency PHY IP core • Transmitter (TX) manual bit-slip mode	• Dedicated deterministic latency PHY IP core • Receiver (RX) deterministic latency state machine
OBSAI RP3	0.768 to 3.072		
V-by-One HS	Up to 3.75	Custom PHY IP core	• Custom PHY IP core • Wider spread of asynchronous SSC
DisplayPort 1.2(17)	1.62 and 2.7		

SoC with HPS

Each SoC combines an FPGA fabric and an HPS in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

HPS Features

The HPS consists of a dual-core Arm Cortex-A9 MPCore processor, a rich set of peripherals, and a shared multiport SDRAM memory controller, as shown in the following figure.

(16) High-voltage output mode (1000-BASE-CX) is not supported.

(17) Pending characterization.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA®) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to slaves in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features. The SDRAM controller subsystem supports DDR2, DDR3, or LPDDR2 devices up to 4 Gb in density operating at up to 400 MHz (800 Mbps data rate).

FPGA Configuration and Processor Booting

The FPGA fabric and HPS in the SoC are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power, or shut down the entire FPGA fabric to reduce total system power.

You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- You can power up both the HPS and the FPGA fabric together, configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

Note: Although the FPGA fabric and HPS are on separate power domains, the HPS must remain powered up during operation while the FPGA fabric can be powered up or down as required.

Related Information

Cyclone V Device Family Pin Connection Guidelines
Provides detailed information about power supply pin connection guidelines and power regulator sharing.

Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer (Standard) system integration tool in the Intel Quartus Prime software.

For software development, the Arm-based SoC devices inherit the rich software development ecosystem available for the Arm Cortex-A9 MPCore processor. The software development process for Intel SoCs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux, VxWorks®, and other operating systems is available for the SoCs. For more information on the operating systems support availability, contact the Intel sales team.

You can begin device-specific firmware and software development on the Intel SoC Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board that runs on a PC. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

International Altera Sales Support Offices

Dynamic and Partial Reconfiguration

The Cyclone V devices support dynamic reconfiguration and partial reconfiguration.

Dynamic Reconfiguration

The dynamic reconfiguration feature allows you to dynamically change the transceiver data rates, PMA settings, or protocols of a channel, without affecting data transfer on adjacent channels. This feature is ideal for applications that require on-the-fly multiprotocol or multirate support. You can reconfigure the PMA and PCS blocks with dynamic reconfiguration.

Partial Reconfiguration

Note: The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Intel sales representatives.

Partial reconfiguration allows you to reconfigure part of the device while other sections of the device remain operational. This capability is important in systems with critical uptime requirements because it allows you to make updates or adjust functionality without disrupting services.

Apart from lowering cost and power consumption, partial reconfiguration increases the effective logic density of the device because placing device functions that do not operate simultaneously is not necessary. Instead, you can store these functions in external memory and load them whenever the functions are required. This capability reduces the size of the device because it allows multiple applications on a single device—saving the board space and reducing the power consumption.

Intel simplifies the time-intensive task of partial reconfiguration by building this capability on top of the proven incremental compile and design flow in the Intel Quartus Prime design software. With the Intel solution, you do not need to know all the intricate device architecture details to perform a partial reconfiguration.

Partial reconfiguration is supported through the FPP x16 configuration interface. You can seamlessly use partial reconfiguration in tandem with dynamic reconfiguration to enable simultaneous partial reconfiguration of both the device core and transceivers.

Enhanced Configuration and Configuration via Protocol

Cyclone V devices support 1.8 V, 2.5 V, 3.0 V, and 3.3 V programming voltages and several configuration schemes.

Table 24. Configuration Schemes and Features Supported by Cyclone V Devices

Mode	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps)	Decompression	Design Security	Partial Reconfiguration[18]	Remote System Update
AS through the EPCS and EPCQ serial configuration device	1 bit, 4 bits	100	—	Yes	Yes	—	Yes
PS through CPLD or external microcontroller	1 bit	125	125	Yes	Yes	—	—
FPP	8 bits	125	—	Yes	Yes	—	Parallel flash loader
	16 bits	125	—	Yes	Yes	Yes	
CvP (PCIe)	x1, x2, and x4 lanes	—	—	Yes	Yes	Yes	—
JTAG	1 bit	33	33	—	—	—	—

Instead of using an external flash or ROM, you can configure the Cyclone V devices through PCIe using CvP. The CvP mode offers the fastest configuration rate and flexibility with the easy-to-use PCIe hard IP block interface. The Cyclone V CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

Related Information

Configuration via Protocol (CvP) Implementation in Intel FPGAs User Guide
Provides more information about CvP.

(18) The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Intel sales representatives.

Power Management

Leveraging the FPGA architectural features, process technology advancements, and transceivers that are designed for power efficiency, the Cyclone V devices consume less power than previous generation Cyclone FPGAs:

- Total device core power consumption—less by up to 40%.
- Transceiver channel power consumption—less by up to 50%.

Additionally, Cyclone V devices contain several hard IP blocks that reduce logic resources and deliver substantial power savings of up to 25% less power than equivalent soft implementations.

Document Revision History for Cyclone V Device Overview

Document Version	Changes
2018.05.07	• Added the low power option ("L" suffix) for Cyclone V SE and Cyclone V SX devices in the *Sample Ordering Code and Available Options* diagrams. • Rebranded as Intel.

Date	Version	Changes
December 2017	2017.12.18	• Updated ALM resources for Cyclone V E, Cyclone V SE, Cyclone V SX, and Cyclone V ST devices.
June 2016	2016.06.10	Updated Cyclone V GT speed grade to –7 in Sample Ordering Code and Available Options for Cyclone V GT Devices diagram.
December 2015	2015.12.21	• Added descriptions to package plan tables for Cyclone V GT and ST devices. • Changed instances of *Quartus II* to *Quartus Prime*.
June 2015	2015.06.12	• Replaced a note to partial reconfiguration feature. Note: The partial reconfiguration feature is available for Cyclone V E, GX, SE, and SX devices with the "SC" suffix in the part number. For device availability and ordering, contact your local Altera sales representatives. • Updated logic elements (LE) (K) for the following devices: — Cyclone V E A7: Updated from 149.5 to 150 — Cyclone V GX C3: Updated from 35.5 to 36 — Cyclone V GX C7: Updated from 149.7 to 150 — Cyclone V GT D7: Updated from 149.5 to 150 • Updated MLAB (Kb) in Maximum Resource Counts for Cyclone V GX Devices table as follows: — Cyclone V GX C3: Updated from 291 to 182 — Cyclone V GX C4: Updated from 678 to 424 — Cyclone V GX C5: Updated from 678 to 424 — Cyclone V GX C7: Updated from 1,338 to 836 — Cyclone V GX C9: Updated from 2,748 to 1,717

Date	Version	Changes
		• Updated MLAB RAM Bit (Kb) in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C3: Updated from 181 to 182 — Cyclone V GX C4: Updated from 295 to 424 • Updated Total RAM Bit (Kb) in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C3: Updated from 1,531 to 1,532 — Cyclone V GX C4: Updated from 2,795 to 2,924 • Updated MLAB Block count in Embedded Memory Capacity and Distribution in Cyclone V Devices table as follows: — Cyclone V GX C4: Updated from 472 to 678 — Cyclone V GX C5: Updated from 679 to 678
March 2015	2015.03.31	• Added internal scrubbing feature under configuration in Summary of Features for Cyclone V Devices table. • Added optional suffix "SC: Internal scrubbing support" to the following diagrams: — Sample Ordering Code and Available Options for Cyclone V E Devices — Sample Ordering Code and Available Options for Cyclone V GX Devices — Sample Ordering Code and Available Options for Cyclone V SE Devices — Sample Ordering Code and Available Options for Cyclone V SX Devices
January 2015	2015.01.23	• Updated Sample Ordering Code and Available Options for Cyclone V ST Devices figure because Cyclone V ST devices are only available in I temperature grade and –7 speed grade. — Operating Temperature: Removed C and A temperature grades — FPGA Fabric Speed Grade: Removed –6 and –8 speed grades • Updated the transceiver specification for Cyclone V ST from 5 Gbps to 6.144 Gbps: — Device Variants for the Cyclone V Device Family table — Sample Ordering Code and Available Options for Cyclone V ST Devices figure — Maximum Resource Counts for Cyclone V ST Devices • Updated Maximum Resource Counts for Cyclone V GX Devices table for Cyclone V GX G3 devices. — Logic elements (LE) (K): Updated from 35.7 to 35.5 — Variable-precision DSP block: Updated from 51 to 57 — 18 x 18 multiplier: Updated from 102 to 114 • Updated Number of Multipliers in Cyclone V Devices table for Cyclone V GX G3 devices. — Variableprecision DSP Block: Updated from 51 to 57 — 9 x 9 Multiplier: Updated from 153 to 171 — 18 x 18 Multiplier: Updated from 102 to 114 — 27 x 27 Multiplier: Updated from 51 to 57 — 18 x 18 Multiplier Adder Mode: Updated from 51 to 57 — 18 x 18 Multiplier Adder Summed with 36 bit Input: Updated from 51 to 57 • Updated Embedded Memory Capacity and Distribution in Cyclone V Devices table for Cyclone V GX G3 devices. — M10K block: Updated from 119 to 135 — M10K RAM bit (Kb): Updated from 1,190 to 1,350 — MLAB block: Updated from 255 to 291 — MLAB RAM bit (Kb): Updated from 159 to 181 — Total RAM bit (Kb): Updated from 1,349 to 1,531
October 2014	2014.10.06	Added a footnote to the "Transceiver PCS Features for Cyclone V Devices" table to show that PCIe Gen2 is supported for Cyclone V GT and ST devices.

continued...

Date	Version	Changes
July 2014	2014.07.07	Updated the I/O vertical migration figure to clarify the migration capability of Cyclone V SE and SX devices.
December 2013	2013.12.26	• Corrected single or dual-core ARM Cortex-A9 MPCore processor-up to 925 MHz from 800 MHz. • Removed "Preliminary" texts from Ordering Code figures, Maximum Resources, Package Plan and I/O Vertical Migration tables. • Removed the note "The number of GPIOs does not include transceiver I/Os. In the Quartus II software, the number of user I/Os includes transceiver I/Os." for GPIOs in the Maximum Resource Counts table for Cyclone V E and SE. • Added link to Altera Product Selector for each device variant. • Updated Embedded Hard IPs for Cyclone V GT devices to indicate Maximum 2 hard PCIe and 2 hard memory controllers. • Added leaded package options. • Removed the note "The number of PLLs includes general-purpose fractional PLLs and transceiver fractional PLLs." for all PLLs in the Maximum Resource Counts table. • Corrected max LVDS counts for transmitter and receiver for Cyclone V E A5 device from 84 to 60. • Corrected max LVDS counts for transmitter and receiver for Cyclone V E A9 device from 140 to 120. • Corrected variable-precision DSP block, 27 x 27 multiplier, 18 x 18 multiplier adder mode and 18 x 18 multiplier adder summed with 36 bit input for Cyclone V SE devices from 58 to 84. • Corrected 18 x 18 multiplier for Cyclone V SE devices from 116 to 168. • Corrected 9 x 9 multiplier for Cyclone V SE devices from 174 to 252. • Corrected LVDS transmitter for Cyclone V SE A2 and A4 as well as SX C2 and C4 devices from 31 to 32. • Corrected LVDS receiver for Cyclone V SE A2 and A4 as well as SX C2 and C4 devices from 35 to 37. • Corrected transceiver speed grade for Cyclone V ST devices ordering code from 4 to 5. • Updated the DDR3 SDRAM for the maximum frequency's soft controller and the minimum frequency from 300 to 303 for voltage 1.35V. • Added links to Altera's External Memory Spec Estimator tool to the topics listing the external memory interface performance. • Corrected XAUI is supported through the soft PCS in the PCS features for Cyclone V. • Added decompression support for the CvP configuration mode.
May 2013	2013.05.06	• Added link to the known document issues in the Knowledge Base. • Moved all links to the Related Information section of respective topics for easy reference. • Corrected the title to the PCIe hard IP topic. Cyclone V devices support only PCIe Gen1 and Gen2. • Updated Supporting Feature in Table 1 of Increased bandwidth capacity to '6.144 Gbps'. • Updated Description in Table 2 of Low-power high-speed serial interface to '6.144 Gbps'. • Updated Description in Table 3 of Cyclone V GT to '6.144 Gbps'. • Updated the M386 package to M383 for Figure 1, Figure 2 and Figure 3. • Updated Figure 2 and Figure 3 for Transceiver Count by adding 'F : 4'. • Updated LVDS in the Maximum Resource Counts tables to include Transmitter and Receiver values. • Updated the package plan with M383 for the Cyclone V E device. • Removed the M301 and M383 packages from the Cyclone V GX C4 device. • Updated the GPIO count to '129' for the M301 package of the Cyclone V GX C5 device. • Updated 5 Gbps to '6.144 Gbps' forCyclone V GT device.

Date	Version	Changes
		• Updated Figure 1, Figure 2, Figure 3, Figure 4, Figure 5, Figure 6, and Figure 10. • Updated the "FPGA Configuration and Processor Booting" and "Hardware and Software Development" sections. • Text edits throughout the document.
February 2012	1.2	• Updated Table 1–2, Table 1–3, and Table 1–6. • Updated "Cyclone V Family Plan" on page 1–4 and "Clock Networks and PLL Clock Sources" on page 1–15. • Updated Figure 1–1 and Figure 1–6.
November 2011	1.1	• Updated Table 1–1, Table 1–2, Table 1–3, Table 1–4, Table 1–5, and Table 1–6. • Updated Figure 1–4, Figure 1–5, Figure 1–6, Figure 1–7, and Figure 1–8. • Updated "System Peripherals" on page 1–18, "HPS–FPGA AXI Bridges" on page 1–19, "HPS SDRAM Controller Subsystem" on page 1–19, "FPGA Configuration and Processor Booting" on page 1–19, and "Hardware and Software Development" on page 1–20. • Minor text edits.
October 2011	1.0	Initial release.
