
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	HC08
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	LVD, POR, PWM
Number of I/O	13
Program Memory Size	1.5KB (1.5K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	16-TSSOP (0.173", 4.40mm Width)
Supplier Device Package	16-TSSOP
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mc908qy1cdter

MC68HC908QY4
MC68HC908QT4
MC68HC908QY2
MC68HC908QT2
MC68HC908QY1
MC68HC908QT1

Data Sheet

To provide the most up-to-date information, the revision of our documents on the World Wide Web will be the most current. Your printed copy may be an earlier revision. To verify you have the latest information available, refer to:

http://freescale.com/

- On-chip in-application programmable FLASH memory (with internal program/erase voltage generation)
  - MC68HC908QY4 and MC68HC908QT4 — 4096 bytes
  - MC68HC908QY2, MC68HC908QY1, MC68HC908QT2, and MC68HC908QT1 — 1536 bytes
- 128 bytes of on-chip random-access memory (RAM)
- 2-channel, 16-bit timer interface module (TIM)
- 4-channel, 8-bit analog-to-digital converter (ADC) on MC68HC908QY2, MC68HC908QY4, MC68HC908QT2, and MC68HC908QT4
- 5 or 13 bidirectional input/output (I/O) lines and one input only:
  - Six shared with keyboard interrupt function and ADC
  - Two shared with timer channels
  - One shared with external interrupt (IRQ)
  - Eight extra I/O lines on 16-pin package only
  - High current sink/source capability on all port pins
  - Selectable pullups on all ports, selectable on an individual bit basis
  - Three-state ability on all port pins
- 6-bit keyboard interrupt with wakeup feature (KBI)
- Low-voltage inhibit (LVI) module features:
  - Software selectable trip point in CONFIG register
- System protection features:
  - Computer operating properly (COP) watchdog
  - Low-voltage detection with reset
  - Illegal opcode detection with reset
  - Illegal address detection with reset
- External asynchronous interrupt pin with internal pullup ($\overline{\text{IRQ}}$) shared with general-purpose input pin
- Master asynchronous reset pin ($\overline{\text{RST}}$) shared with general-purpose input/output (I/O) pin
- Power-on reset
- Internal pullups on $\overline{\text{IRQ}}$ and $\overline{\text{RST}}$ to reduce external components
- Memory mapped I/O registers
- Power saving stop and wait modes
- MC68HC908QY4, MC68HC908QY2, and MC68HC908QY1 are available in these packages:
  - 16-pin plastic dual in-line package (PDIP)
  - 16-pin small outline integrated circuit (SOIC) package
  - 16-pin thin shrink small outline package (TSSOP)
- MC68HC908QT4, MC68HC908QT2, and MC68HC908QT1 are available in these packages:
  - 8-pin PDIP
  - 8-pin SOIC
  - 8-pin dual flat no lead (DFN) package

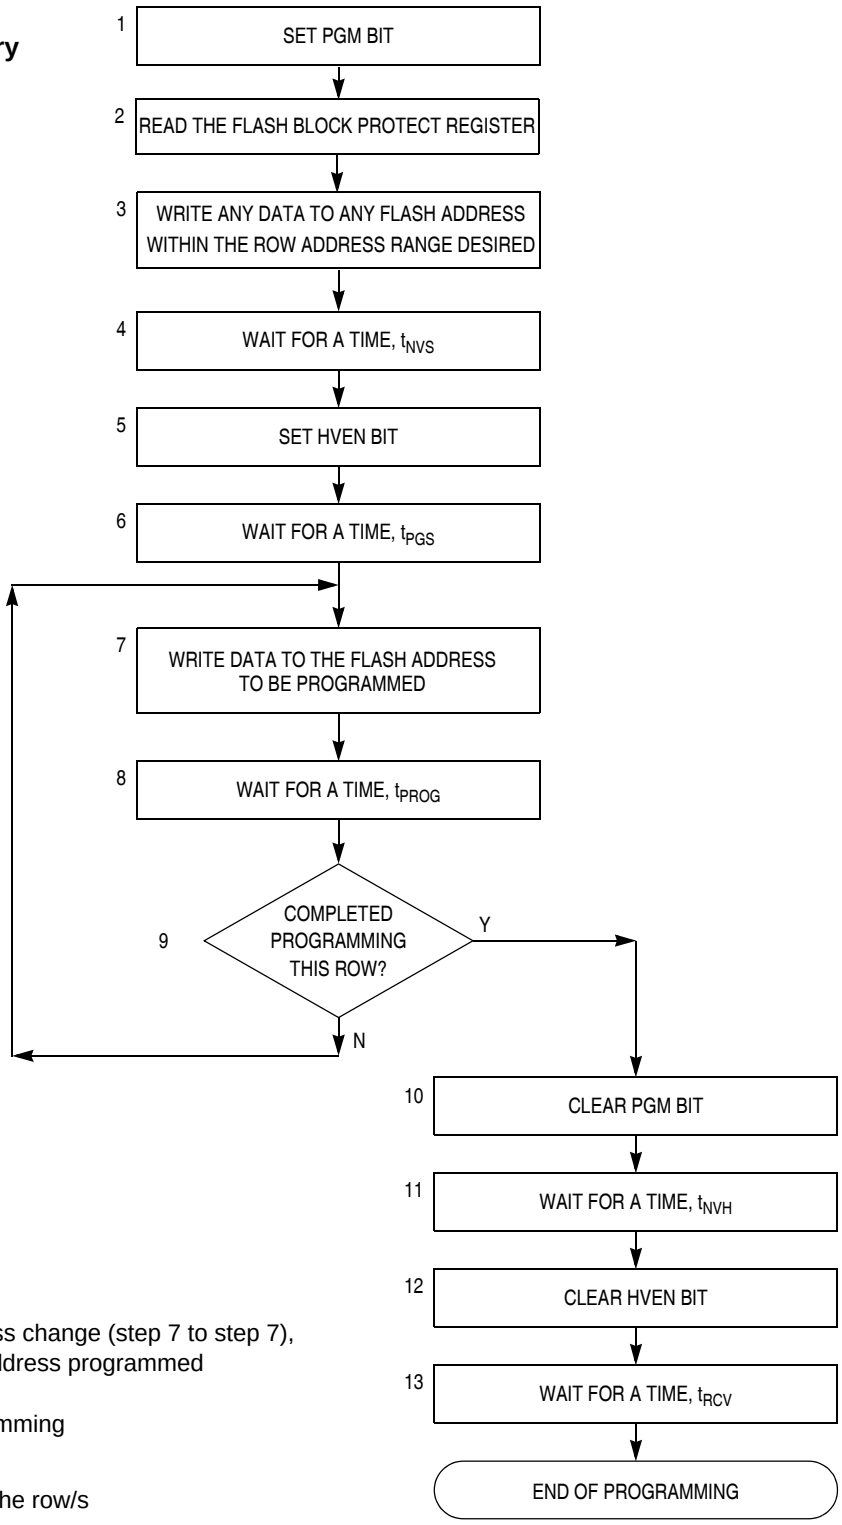
Figure 2-2. Control, Status, and Data Registers (Sheet 5 of 5)

Algorithm for Programming a Row (32 Bytes) of FLASH Memory



NOTES:

The time between each FLASH address change (step 7 to step 7), or the time between the last FLASH address programmed to clearing PGM bit (step 7 to step 10) must not exceed the maximum programming time, t_{PROG} max.

This row program algorithm assumes the row/s to be programmed are initially erased.

Figure 2-4. FLASH Programming Flowchart

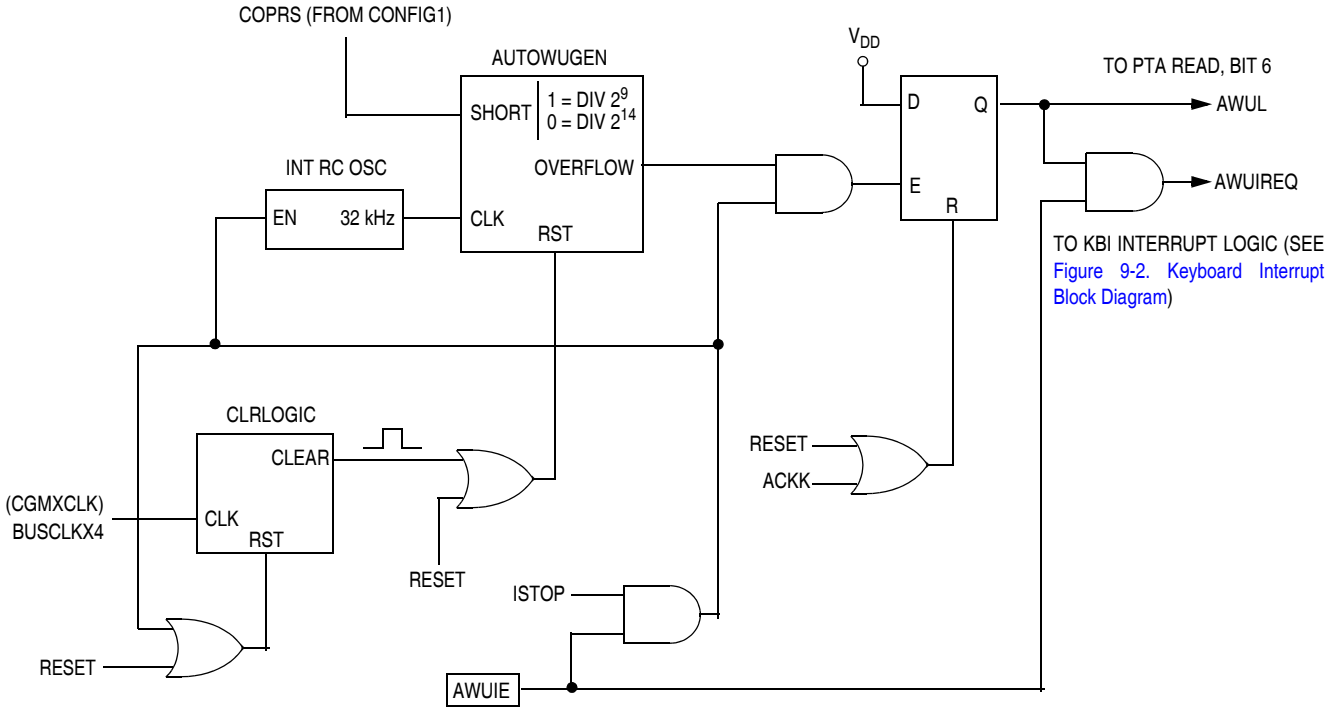


Figure 4-1. Auto Wakeup Interrupt Request Generation Logic

The auto wakeup RC oscillator is highly dependent on operating voltage and temperature. This feature is not recommended for use as a time-keeping function.

The wakeup request is latched to allow the interrupt source identification. The latched value, AWUL, can be read directly from the bit 6 position of PTA data register. This is a read-only bit which is occupying an empty bit position on PTA. No PTA associated registers, such as PTA6 data, PTA6 direction, and PTA6 pullup exist for this bit. The latch can be cleared by writing to the ACKK bit in the KBSCR register. Reset also clears the latch. AWUIE bit in KBI interrupt enable register (see Figure 4-1) has no effect on AWUL reading.

The AWU oscillator and counters are inactive in normal operating mode and become active only upon entering stop mode.

4.4 Wait Mode

The AWU module remains inactive in wait mode.

4.5 Stop Mode

When the AWU module is enabled (AWUIE = 1 in the keyboard interrupt enable register) it is activated automatically upon entering stop mode. Clearing the IMASKK bit in the keyboard status and control register enables keyboard interrupt requests to bring the MCU out of stop mode. The AWU counters start from ‘0’ each time stop mode is entered.

Chapter 10
Low-Voltage Inhibit (LVI)

10.1 Introduction

This section describes the low-voltage inhibit (LVI) module, which monitors the voltage on the V_{DD} pin and can force a reset when the V_{DD} voltage falls below the LVI trip falling voltage, V_{TRIPF}.

10.2 Features

Features of the LVI module include:

- Programmable LVI reset
- Programmable power consumption
- Selectable LVI trip voltage
- Programmable stop mode operation

10.3 Functional Description

Figure 10-1 shows the structure of the LVI module. LVISTOP, LVIPWRD, LVI5OR3, and LVIRSTD are user selectable options found in the configuration register (CONFIG1). See Chapter 5 Configuration Register (CONFIG).

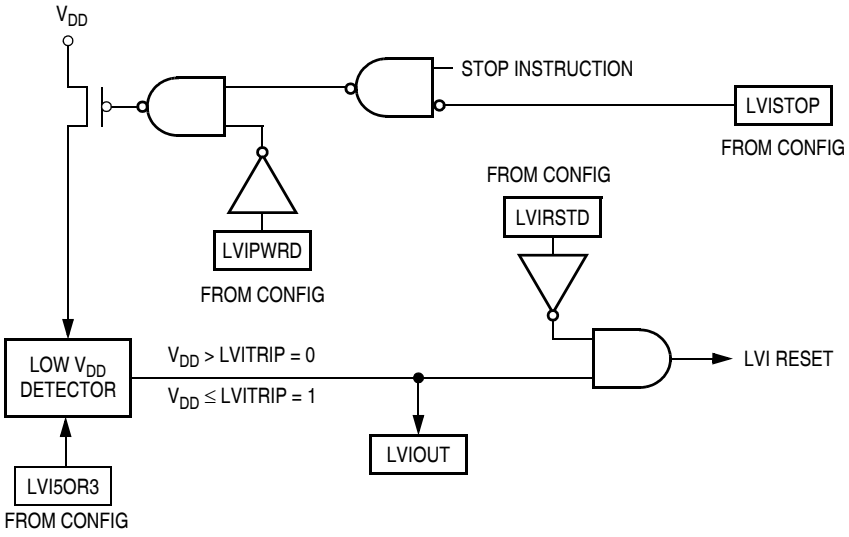

Figure 10-1. LVI Module Block Diagram

The LVI is enabled out of reset. The LVI module contains a bandgap reference circuit and comparator. Clearing the LVI power disable bit, LVIPWRD, enables the LVI to monitor V_{DD} voltage. Clearing the LVI reset disable bit, LVIRSTD, enables the LVI module to generate a reset when V_{DD} falls below a voltage,

V_{TRIPF}. Setting the LVI enable in stop mode bit, LVISTOP, enables the LVI to operate in stop mode. Setting the LVI 5-V or 3-V trip point bit, LVI5OR3, enables the trip point voltage, V_{TRIPF}, to be configured for 5-V operation. Clearing the LVI5OR3 bit enables the trip point voltage, V_{TRIPF}, to be configured for 3-V operation. The actual trip thresholds are specified in 16.5 5-V DC Electrical Characteristics and 16.9 3-V DC Electrical Characteristics.

NOTE

After a power-on reset, the LVI's default mode of operation is 3 volts. If a 5-V system is used, the user must set the LVI5OR3 bit to raise the trip point to 5-V operation.

If the user requires 5-V mode and sets the LVI5OR3 bit after power-on reset while the V_{DD} supply is not above the V_{TRIPR} for 5-V mode, the microcontroller unit (MCU) will immediately go into reset. The next time the LVI releases the reset, the supply will be above the V_{TRIPR} for 5-V mode.

Once an LVI reset occurs, the MCU remains in reset until V_{DD} rises above a voltage, V_{TRIPR}, which causes the MCU to exit reset. See Chapter 13 System Integration Module (SIM) for the reset recovery sequence.

The output of the comparator controls the state of the LVIOUT flag in the LVI status register (LVISR) and can be used for polling LVI operation when the LVI reset is disabled.

10.3.1 Polled LVI Operation

In applications that can operate at V_{DD} levels below the V_{TRIPF} level, software can monitor V_{DD} by polling the LVIOUT bit. In the configuration register, the LVIPWRD bit must be cleared to enable the LVI module, and the LVIRSTD bit must be at set to disable LVI resets.

10.3.2 Forced Reset Operation

In applications that require V_{DD} to remain above the V_{TRIPF} level, enabling LVI resets allows the LVI module to reset the MCU when V_{DD} falls below the V_{TRIPF} level. In the configuration register, the LVIPWRD and LVIRSTD bits must be cleared to enable the LVI module and to enable LVI resets.

10.3.3 Voltage Hysteresis Protection

Once the LVI has triggered (by having V_{DD} fall below V_{TRIPF}), the LVI will maintain a reset condition until V_{DD} rises above the rising trip point voltage, V_{TRIPR}. This prevents a condition in which the MCU is continually entering and exiting reset if V_{DD} is approximately equal to V_{TRIPF}. V_{TRIPR} is greater than V_{TRIPF} by the hysteresis voltage, V_{HYS}.

10.3.4 LVI Trip Selection

The LVI5OR3 bit in the configuration register selects whether the LVI is configured for 5-V or 3-V protection.

NOTE

The microcontroller is guaranteed to operate at a minimum supply voltage. The trip point (V_{TRIPF} [5 V] or V_{TRIPF} [3 V]) may be lower than this. See 16.5 5-V DC Electrical Characteristics and 16.9 3-V DC Electrical Characteristics for the actual trip point voltages.

12.3.2 Data Direction Register B

Data direction register B (DDRB) determines whether each port B pin is an input or an output. Writing a 1 to a DDRB bit enables the output buffer for the corresponding port B pin; a 0 disables the output buffer.

Address: $0005

	Bit 7	6	5	4	3	2	1	Bit 0
Read: Write:	DDRB7	DDRB6	DDRB5	DDRB4	DDRB3	DDRB2	DDRB1	DDRB0
Reset:	0	0	0	0	0	0	0	0

Figure 12-6. Data Direction Register B (DDRB)

DDRB[7:0] — Data Direction Register B Bits

These read/write bits control port B data direction. Reset clears DDRB[7:0], configuring all port B pins as inputs.

1 = Corresponding port B pin configured as output
0 = Corresponding port B pin configured as input

NOTE

Avoid glitches on port B pins by writing to the port B data register before changing data direction register B bits from 0 to 1. Figure 12-7 shows the port B I/O logic.

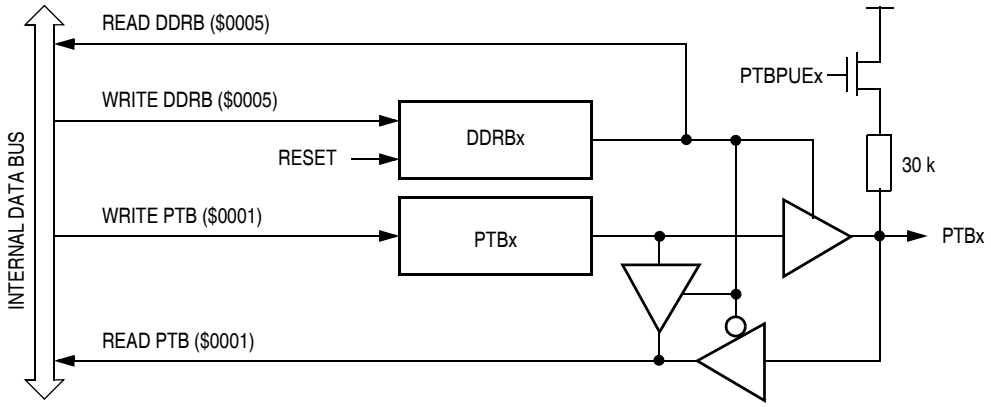

Figure 12-7. Port B I/O Circuit

When DDRBx is a 1, reading address $0001 reads the PTBx data latch. When DDRBx is a 0, reading address $0001 reads the voltage level on the pin. The data latch can always be written, regardless of the state of its data direction bit. Table 12-2 summarizes the operation of the port B pins.

Table 12-2. Port B Pin Functions

DDRB Bit	PTB Bit	I/O Pin Mode	Accesses to DDRB	Accesses to PTB	
			Read/Write	Read	Write
0	X(1)	Input, Hi-Z(2)	DDRB7–DDRB0	Pin	PTB7–PTB0(3)
1	X	Output	DDRB7–DDRB0	Pin	PTB7–PTB0

1. X = don't care
2. Hi-Z = high impedance
3. Writing affects data register, but does not affect the input.

14.4 Functional Description

Figure 14-2 shows the structure of the TIM. The central component of the TIM is the 16-bit TIM counter that can operate as a free-running counter or a modulo up-counter. The TIM counter provides the timing reference for the input capture and output compare functions. The TIM counter modulo registers, TMODH:TMODL, control the modulo value of the TIM counter. Software can read the TIM counter value at any time without affecting the counting sequence.

The two TIM channels are programmable independently as input capture or output compare channels.

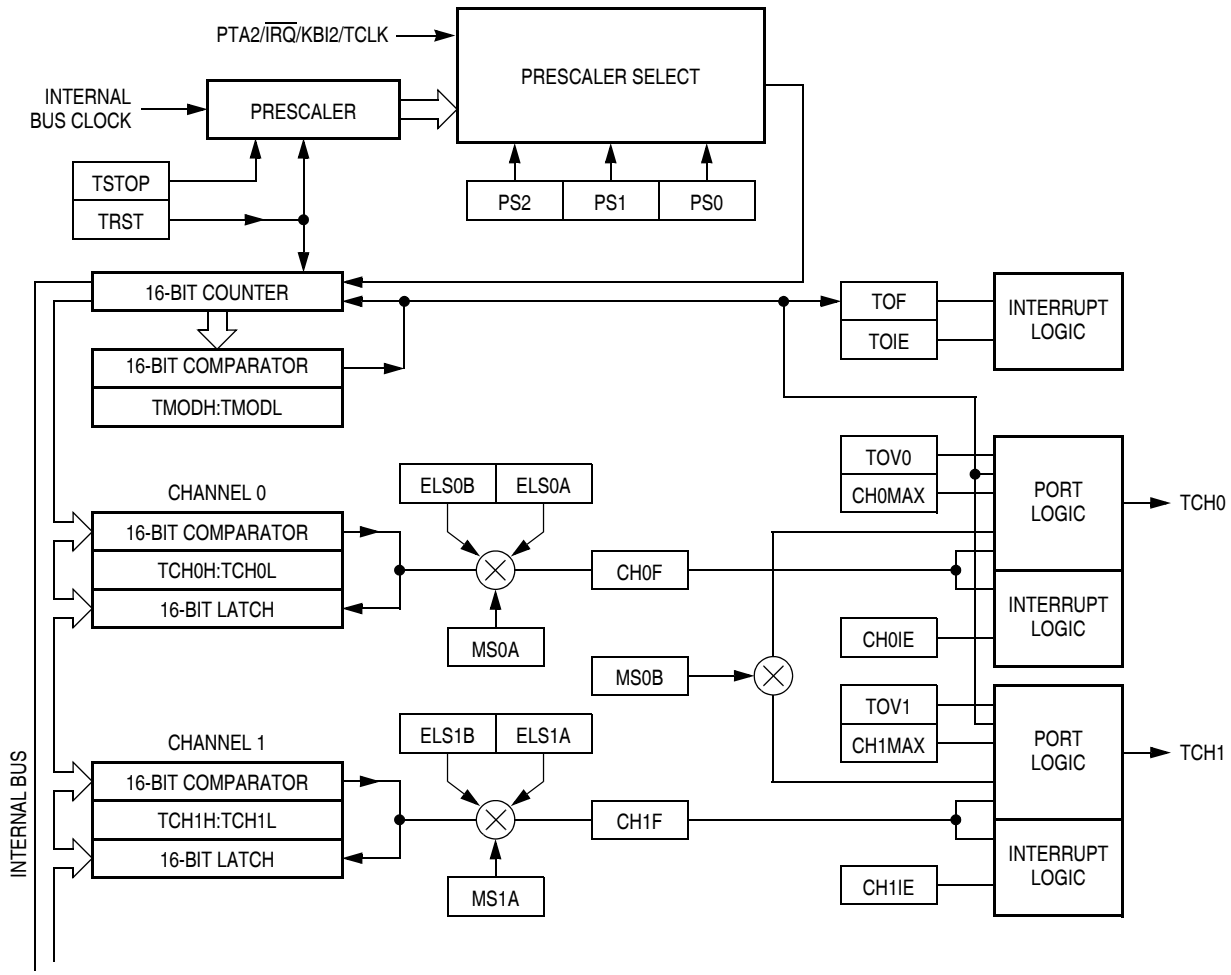

Figure 14-2. TIM Block Diagram

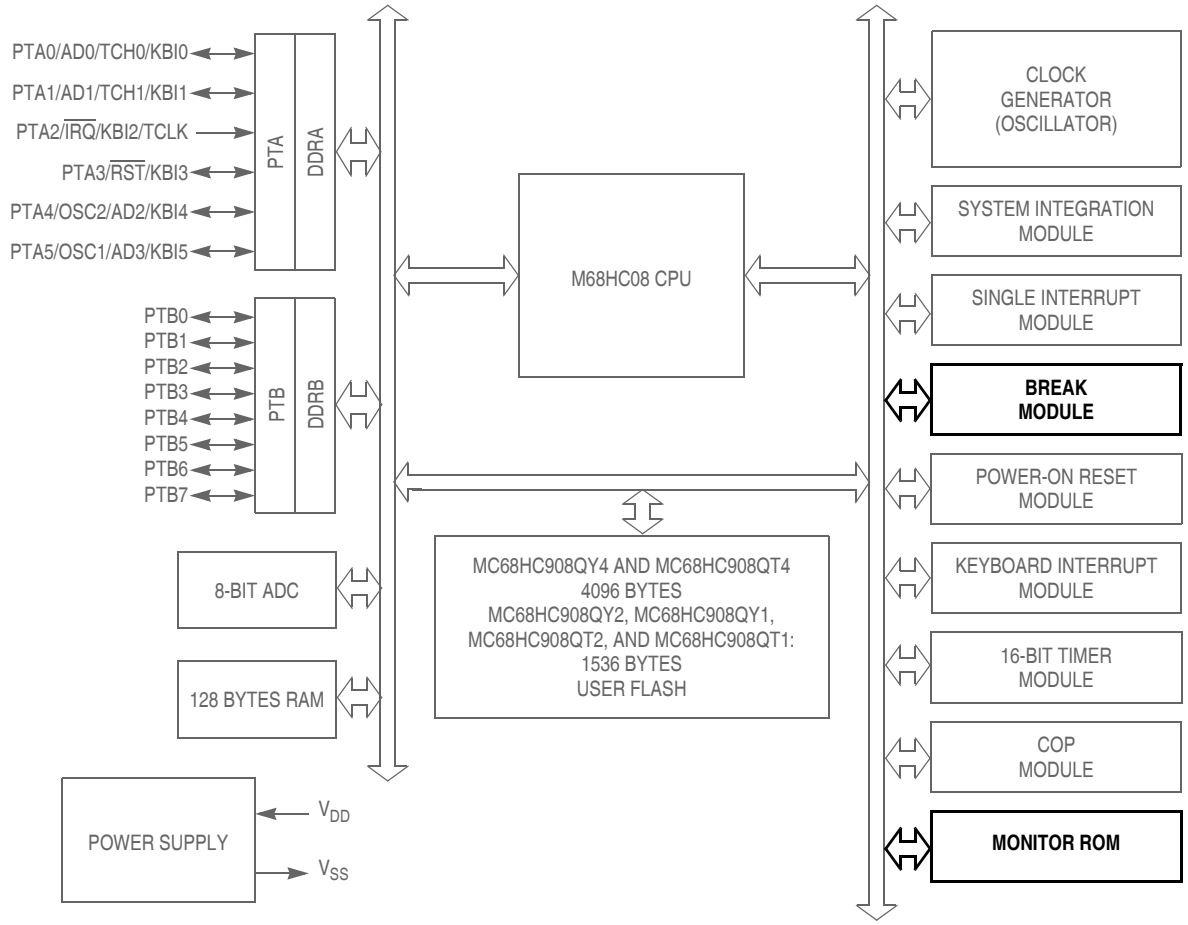

RST, IRQ: Pins have internal (about 30K Ohms) pull up
PTA[0:5]: High current sink and source capability
PTA[0:5]: Pins have programmable keyboard interrupt and pull up
PTB[0:7]: Not available on 8-pin devices – MC68HC908QT1, MC68HC908QT2, and MC68HC908QT4 (see note in 12.1 Introduction)
ADC: Not available on the MC68HC908QY1 and MC68HC908QT1

Figure 15-1. Block Diagram Highlighting BRK and MON Blocks

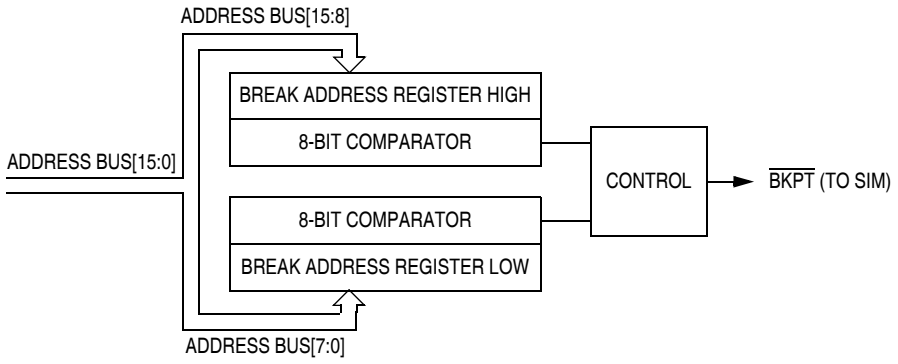

Figure 15-2. Break Module Block Diagram

15.2.2.1 Break Status and Control Register

The break status and control register (BRKSCR) contains break module enable and status bits.

Address: $FE0B

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	BRKE	BRKA	0	0	0	0	0	0
Write:								
Reset:	0	0	0	0	0	0	0	0

= Unimplemented

Figure 15-3. Break Status and Control Register (BRKSCR)

BRKE — Break Enable Bit

This read/write bit enables breaks on break address register matches. Clear BRKE by writing a 0 to bit 7. Reset clears the BRKE bit.

1 = Breaks enabled on 16-bit address match
0 = Breaks disabled

BRKA — Break Active Bit

This read/write status and control bit is set when a break address match occurs. Writing a 1 to BRKA generates a break interrupt. Clear BRKA by writing a 0 to it before exiting the break routine. Reset clears the BRKA bit.

1 = Break address match
0 = No break address match

15.2.2.2 Break Address Registers

The break address registers (BRKH and BRKL) contain the high and low bytes of the desired breakpoint address. Reset clears the break address registers.

Address: $FE09

	Bit 7	6	5	4	3	2	1	Bit 0
Read:	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8
Write:								
Reset:	0	0	0	0	0	0	0	0

Figure 15-4. Break Address Register High (BRKH)

Address: $FE0A

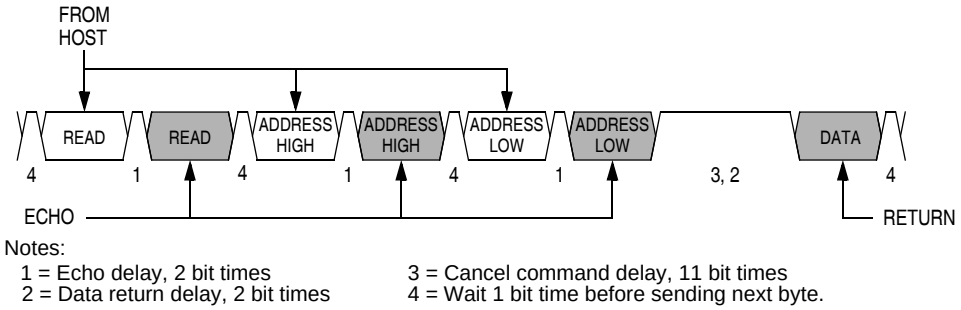
	Bit 7	6	5	4	3	2	1	Bit 0
Read:	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Write:								
Reset:	0	0	0	0	0	0	0	0

Figure 15-5. Break Address Register Low (BRKL)

The monitor ROM firmware echoes each received byte back to the PTA0 pin for error checking. An 11-bit delay at the end of each command allows the host to send a break character to cancel the command. A delay of two bit times occurs before each echo and before READ, IREAD, or READSP data is returned. The data returned by a read command appears after the echo of the last byte of the command.

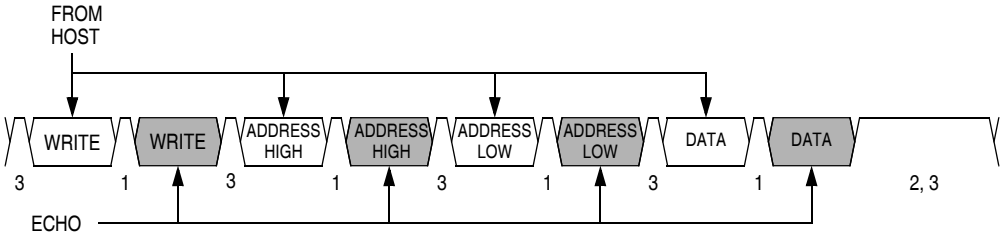
NOTE

Wait one bit time after each echo before sending the next byte.



Notes:
1 = Echo delay, 2 bit times
2 = Data return delay, 2 bit times
3 = Cancel command delay, 11 bit times
4 = Wait 1 bit time before sending next byte.

Figure 15-15. Read Transaction



Notes:
1 = Echo delay, 2 bit times
2 = Cancel command delay, 11 bit times
3 = Wait 1 bit time before sending next byte.

Figure 15-16. Write Transaction

A brief description of each monitor mode command is given in Table 15-3 through Table 15-8.

Total dc current injection (sum of all I/O)	I_{INJTOT}	–25	—	+25	mA
Ports Hi-Z leakage current	I_{IL}	–1	±0.1	+1	µA
Capacitance Ports (as input) Ports (as input)	 C_{IN} C_{OUT}	 — —	 — —	 12 8	pF
POR rearm voltage[3]	V_{POR}	0	—	100	mV
POR rise time ramp rate[4]	R_{POR}	0.035	—	—	V/ms
Monitor mode entry voltage	V_{TST}	V_{DD} + 2.5	—	9.1	V
Pullup resistors[5] PTA0–PTA5, PTB0–PTB7	R_{PU}	16	26	36	kΩ
Low-voltage inhibit reset, trip falling voltage	V_{TRIPF}	3.90	4.20	4.50	V
Low-voltage inhibit reset, trip rising voltage	V_{TRIPR}	4.00	4.30	4.60	V
Low-voltage inhibit reset/recover hysteresis	V_{HYS}	—	100	—	mV

1. V_{DD} = 4.5 to 5.5 Vdc, V_{SS} = 0 Vdc, T_A = T_L to T_H, unless otherwise noted.
2. Typical values reflect average measurements at midpoint of voltage range, 25•C only.
3. Maximum is highest voltage that POR is guaranteed.
4. If minimum V_{DD} is not reached before the internal POR reset is released, the LVI will hold the part in reset until minimum V_{DD} is reached.
5. R_{PU} is measured at V_{DD} = 5.0 V.

16.9 3-V DC Electrical Characteristics

Characteristic[1]	Symbol	Min	Typ[2]	Max	Unit
Output high voltage I_{Load} = –0.6 mA, all I/O pins I_{Load} = –4.0 mA, all I/O pins I_{Load} = –10.0 mA, PTA0, PTA1, PTA3–PTA5 only	V_{OH}	 V_{DD}–0.3 V_{DD}–1.0 V_{DD}–0.8	 — — —	 — — —	V
Maximum combined I_{OH} (all I/O pins)	I_{OHT}	—	—	50	mA
Output low voltage I_{Load} = 0.5 mA, all I/O pins I_{Load} = 6.0 mA, all I/O pins I_{Load} = 10.0 mA, PTA0, PTA1, PTA3–PTA5 only	V_{OL}	 — — —	 — — —	 0.3 1.0 0.8	V
Maximum combined I_{OL} (all I/O pins)	I_{OLT}	—	—	50	mA
Input high voltage PTA0–PTA5, PTB0–PTB7	V_{IH}	0.7 x V_{DD}	—	V_{DD}	V
Input low voltage PTA0–PTA5, PTB0–PTB7	V_{IL}	V_{SS}	—	0.3 x V_{DD}	V
Input hysteresis	V_{HYS}	0.06 x V_{DD}	—	—	V
DC injection current, all ports	I_{INJ}	–2	—	+2	mA
Total dc current injection (sum of all I/O)	I_{INJTOT}	–25	—	+25	mA
Ports Hi-Z leakage current	I_{IL}	–1	±0.1	+1	µA
Capacitance Ports (as input) Ports (as input)	 C_{IN} C_{OUT}	 — —	 — —	 12 8	pF
POR rearm voltage[3]	V_{POR}	0	—	100	mV
POR rise time ramp rate[4]	R_{POR}	0.035	—	—	V/ms
Monitor mode entry voltage	V_{TST}	V_{DD} + 2.5	—	V_{DD} + 4.0	V
Pullup resistors[5] PTA0–PTA5, PTB0–PTB7	R_{PU}	16	26	36	kΩ
Low-voltage inhibit reset, trip falling voltage	V_{TRIPF}	2.40	2.55	2.70	V
Low-voltage inhibit reset, trip rising voltage	V_{TRIPR}	2.50	2.65	2.80	V
Low-voltage inhibit reset/recover hysteresis	V_{HYS}	—	60	—	mV

1. V_{DD} = 2.7 to 3.3 Vdc, V_{SS} = 0 Vdc, T_A = T_L to T_H, unless otherwise noted.
2. Typical values reflect average measurements at midpoint of voltage range, 25•C only.
3. Maximum is highest voltage that POR is guaranteed.
4. If minimum V_{DD} is not reached before the internal POR reset is released, the LVI will hold the part in reset until minimum V_{DD} is reached.
5. R_{PU} are measured at V_{DD} = 3.0 V

16.12 3-V Oscillator Characteristics

Characteristic	Symbol	Min	Typ	Max	Unit
Internal oscillator frequency(1)	f_{INTCLK}	—	12.8	—	MHz
Deviation from trimmed Internal oscillator (2)(3) 12.8 MHz, fixed voltage, fixed temp 12.8 MHz, V_{DD} ± 10%, 0 to 70°C 12.8 MHz, V_{DD} ± 10%, –40 to 125°C	ACC_{INT}	— — —	± 0.4 ± 2 —	— — ± 5	%
Crystal frequency, XTALCLK(1)	$f_{OSCXCLK}$	1	—	16	MHz
External RC oscillator frequency, RCCLK (1)	f_{RCCLK}	2	—	10	MHz
External clock reference frequency(1) (4)	$f_{OSCXCLK}$	dc	—	16	MHz
Crystal load capacitance(5)	C_L	—	20	—	pF
Crystal fixed capacitance(3)	C_1	—	2 x C_L	—	—
Crystal tuning capacitance(3)	C_2	—	2 x C_L	—	—
Feedback bias resistor	R_B	0.5	1	10	MΩ
RC oscillator external resistor	R_{EXT}	See Figure 16-8			—
Crystal series damping resistor $f_{OSCXCLK}$ = 1 MHz $f_{OSCXCLK}$ = 4 MHz $f_{OSCXCLK}$ = > 8 MHz	R_S	— — —	10 5 0	— — —	kΩ

1. Bus frequency, f_{OP}, is oscillator frequency divided by 4.
2. Deviation values assumes trimming @25•C and midpoint of voltage range.
3. Values are based on characterization results, not tested in production.
4. No more than 10% duty cycle deviation from 50%
5. Consult crystal vendor data sheet
