### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	18144
Number of Logic Elements/Cells	-
Total RAM Bits	165888
Number of I/O	418
Number of Gates	1000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Through Hole
Operating Temperature	-55°C ~ 125°C (TA)
Package / Case	624-BCCGA
Supplier Device Package	624-CCGA (32.5x32.5)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microsemi/ax1000-cgs624m">https://www.e-xfl.com/product-detail/microsemi/ax1000-cgs624m</a>

## General Description

The SRAM blocks are arranged in a column on the west side of the tile (Figure 1-6 on page 1-4).

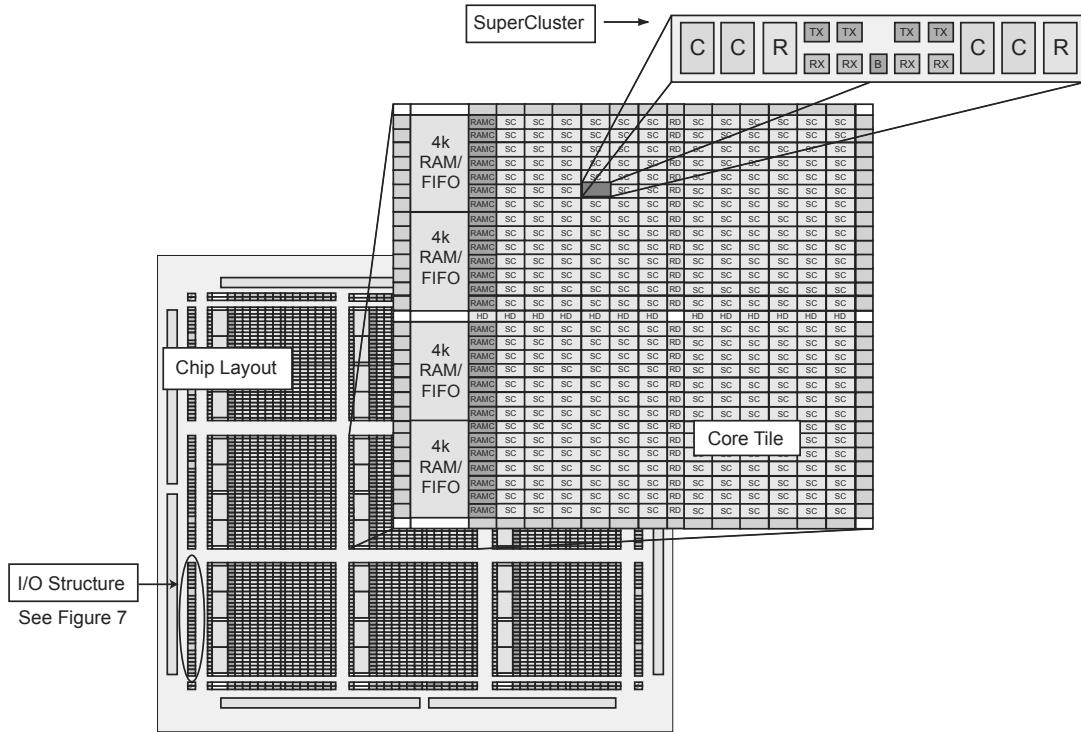

Figure 1-6 • AX Device Architecture (AX1000 shown)

## Embedded Memory

As mentioned earlier, each core tile has either three (in a smaller tile) or four (in the regular tile) embedded SRAM blocks along the west side, and each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are: 128x36, 256x18, 512x9, 1kx4, 2kx2 or 4kx1 bits. The individual blocks have separate read and write ports that can be configured with different bit widths on each port. For example, data can be written in by eight and read out by one.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using core logic modules. The FIFO width and depth are programmable. The FIFO also features programmable ALMOST-EMPTY (AEMPTY) and ALMOST-FULL (AFULL) flags in addition to the normal EMPTY and FULL flags. In addition to the flag logic, the embedded FIFO control unit also contains the counters necessary for the generation of the read and write address pointers as well as control circuitry to prevent metastability and erroneous operation. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

## I/O Logic

The Axcelerator family of FPGAs features a flexible I/O structure, supporting a range of mixed voltages with its bank-selectable I/Os: 1.5V, 1.8V, 2.5V, and 3.3V. In all, Axcelerator FPGAs support at least 14 different I/O standards (single-ended, differential, voltage-referenced). The I/Os are organized into banks, with eight banks per device (two per side). The configuration of these banks determines the I/O standards supported (see "User I/Os" on page 2-11 for more information). All I/O standards are available in each bank.

Each I/O module has an input register (InReg), an output register (OutReg), and an enable register (EnReg) (Figure 1-7 on page 1-5). An I/O Cluster includes two I/O modules, four RX modules, two TX modules, and a buffer (B) module.

## I/O Standard Electrical Specifications

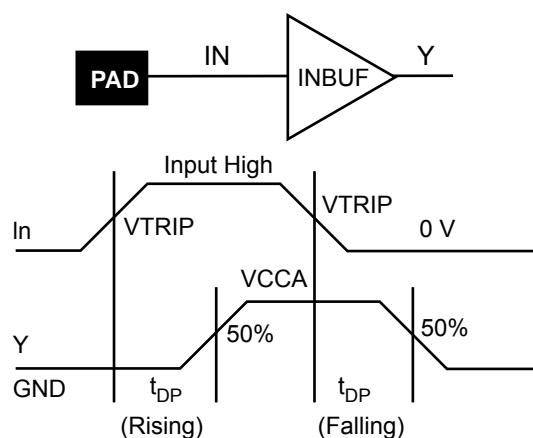

**Table 2-18 • Input Capacitance**

Symbol	Parameter	Conditions	Min.	Max.	Units
$C_{IN}$	Input Capacitance	$V_{IN} = 0, f = 1.0 \text{ MHz}$		10	pF
$C_{INCLK}$	Input Capacitance on HCLK and RCLK Pin	$V_{IN} = 0, f = 1.0 \text{ MHz}$		10	pF

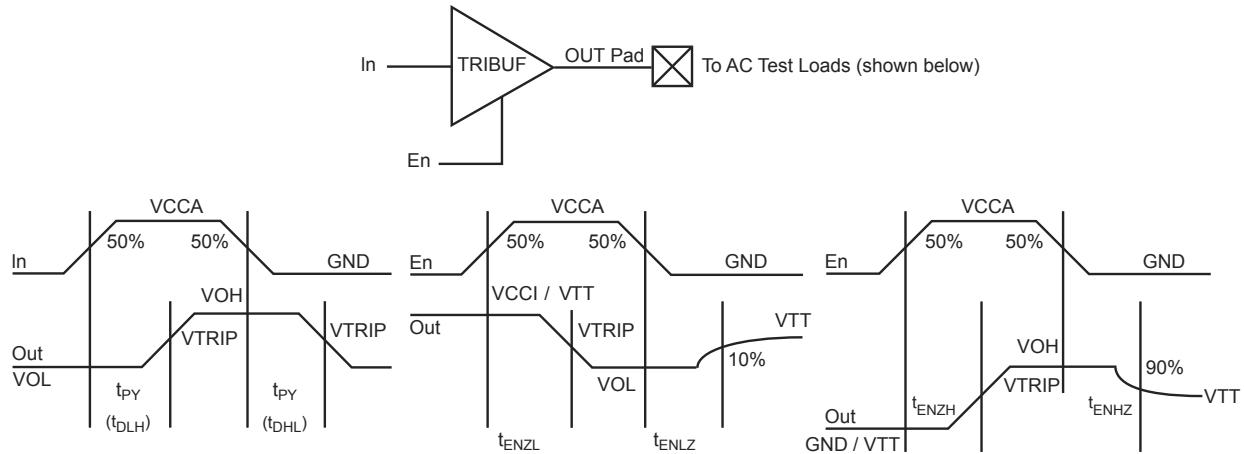

**Table 2-19 • I/O Input Rise Time and Fall Time\***

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)
LVTTL	No Requirement	50 ns
LVCMOS 2.5V	No Requirement	50 ns
LVCMOS 1.8V	No Requirement	50 ns
LVCMOS 1.5V	No Requirement	50 ns
PCI	No Requirement	50 ns
PCIX	No Requirement	50 ns
GTL+	No Requirement	50 ns
HSTL	No Requirement	50 ns
SSTL2	No Requirement	50 ns
HSTL3	No Requirement	50 ns
LVDS	No Requirement	50 ns
LVPECL	No Requirement	50 ns

Note: \*Input Rise/Fall time applies to all inputs, be it clock or data. Inputs have to ramp up/down linearly, in a monotonic way. Glitches or a plateau may cause double clocking. They must be avoided. For output rise/fall time, refer to the IBIS models for extraction.

$t_{PRESET}$	Asynchronous Preset-to-Q		0.23		0.27		0.31	ns

**Implementation Example:**

Figure 2-47 shows a complex clock distribution example. The reference clock (RefCLK) of PLLE is being sourced from non-clock signal pins (INBUF to PLLINT). The CLK1 output of PLLE is being fed to the RefCLK input of PLLF. The CLK2 output of PLLE is driving logic (via PLLOUT). In turn, this logic is driving the global resource CLKE. PLLF is driving both CLKF and CLKG global resources.

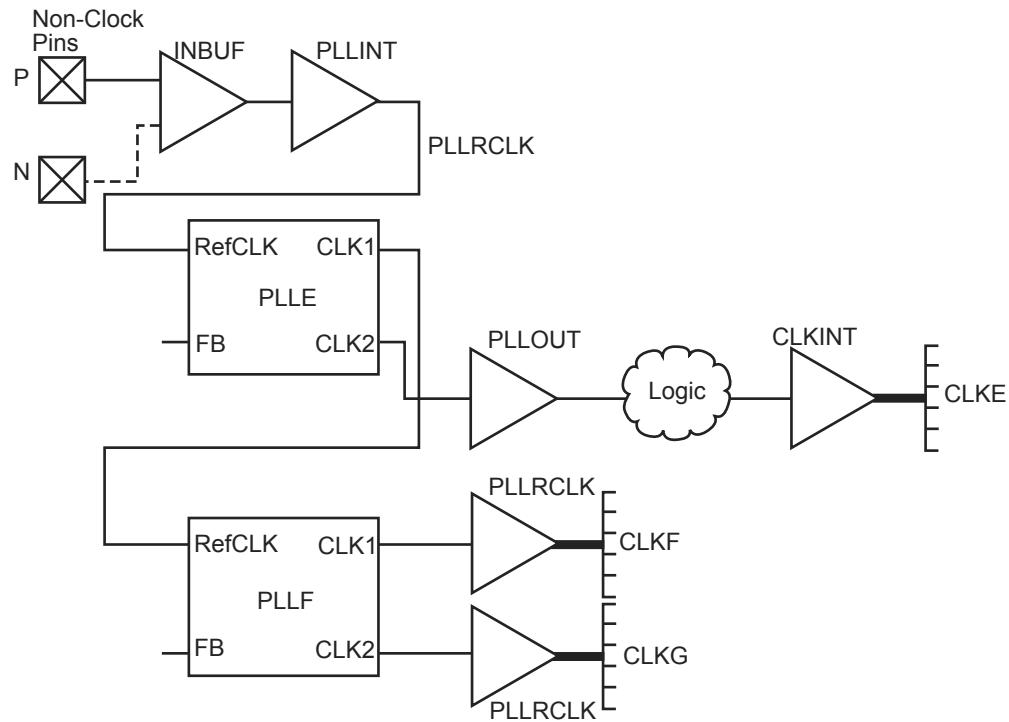

Figure 2-47 • Complex Clock Distribution Example

## FIFO

Every memory block has its own embedded FIFO controller. Each FIFO block has one read port and one write port. This embedded FIFO controller uses no internal FPGA logic and features:

- Glitch-free FIFO Flags
- Gray-code address counters/pointers to prevent metastability problems
- Overflow and underflow control

Both ports are configurable in various sizes from 4k x 1 to 128 x 36, similar to the RAM block size. Each port is fully synchronous.

Read and write operations can be completely independent. Data on the appropriate WD pins are written to the FIFO on every active WCLK edge as long as WEN is high. Data is read from the FIFO and output on the appropriate RD pins on every active RCLK edge as long as REN is asserted.

The FIFO block offers programmable almost-empty (AEMPTY) and almost-full (AFULL) flags as well as EMPTY and FULL flags (Figure 2-61):

- The FULL flag is synchronous to WCLK. It allows the FIFO to inhibit writing when full.
- The EMPTY flag is synchronous to RCLK. It allows the FIFO to inhibit reading at the empty condition.

Gray code counters are used to prevent metastability problems associated with flag logic. The depth of the FIFO is dependent on the data width and the number of memory blocks used to create the FIFO. The write operations to the FIFO are synchronous with respect to the WCLK, and the read operations are synchronous with respect to the RCLK.

The FIFO block may be reset to the empty state.
