

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	2016
Number of Logic Elements/Cells	-
Total RAM Bits	18432
Number of I/O	138
Number of Gates	125000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/ax125-1fgg256i

User-Defined Supply Pins

VREF**Supply Voltage**

Reference voltage for I/O banks. VREF pins are configured by the user from regular I/O pins; VREF pins are not in fixed locations. There can be one or more VREF pins in an I/O bank.

Global Pins

HCLKA/B/C/D**Dedicated (Hardwired) Clocks A, B, C and D**

These pins are the clock inputs for sequential modules or north PLLs. Input levels are compatible with all supported I/O standards. There is a P/N pin pair for support of differential I/O standards. Single-ended clock I/Os can only be assigned to the P side of a paired I/O. This input is directly wired to each R-cell and offers clock speeds independent of the number of R-cells being driven. When the HCLK pins are unused, it is recommended that they are tied to ground.

CLKE/F/G/H**Routed Clocks E, F, G, and H**

These pins are clock inputs for clock distribution networks or south PLLs. Input levels are compatible with all supported I/O standards. There is a P/N pin pair for support of differential I/O standards. Single-ended clock I/Os can only be assigned to the P side of a paired I/O. The clock input is buffered prior to clocking the R-cells. When the CLK pins are unused, Microsemi recommends that they are tied to ground.

JTAG/Probe Pins

PRA/B/C/D**Probe A, B, C and D**

The Probe pins are used to output data from any user-defined design node within the device (controlled with Silicon Explorer II). These independent diagnostic pins can be used to allow real-time diagnostic output of any signal path within the device. The pins' probe capabilities can be permanently disabled to protect programmed design confidentiality. The probe pins are of LVTTL output levels.

TCK**Test Clock**

Test clock input for JTAG boundary-scan testing and diagnostic probe (Silicon Explorer II).

TDI**Test Data Input**

Serial input for JTAG boundary-scan testing and diagnostic probe. TDI is equipped with an internal 10 k Ω pull-up resistor.

TDO**Test Data Output**

Serial output for JTAG boundary-scan testing.

TMS**Test Mode Select**

The TMS pin controls the use of the IEEE 1149.1 boundary-scan pins (TCK, TDI, TDO, TRST). TMS is equipped with an internal 10 k Ω pull-up resistor.

TRST**Boundary Scan Reset Pin**

The TRST pin functions as an active-low input to asynchronously initialize or reset the boundary scan circuit. The TRST pin is equipped with a 10 k Ω pull-up resistor.

Special Functions

LP**Low Power Pin**

The LP pin controls the low power mode of Axcelerator devices. The device is placed in the low power mode by connecting the LP pin to logic high. To exit the low power mode, the LP pin must be set Low. Additionally, the LP pin must be set Low during chip powering-up or chip powering-down operations. See "Low Power Mode" on page 2-106 for more details.

NC**No Connection**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

Global Resources

One of the most important aspects of any FPGA architecture is its global resources or clocks. The Axcelerator family provides the user with flexible and easy-to-use global resources, without the limitations normally found in other FPGA architectures.

The AX architecture contains two types of global resources, the HCLK (hardwired clock) and CLK (routed clock). Every Axcelerator device is provided with four HCLKs and four CLKS for a total of eight clocks, regardless of device density.

Hardwired Clocks

The hardwired (HCLK) is a low-skew network that can directly drive the clock inputs of all sequential modules (R-cells, I/O registers, and embedded RAM/FIFOs) in the device with no antifuse in the path. All four HCLKs are available everywhere on the chip.

Timing Characteristics

Table 2-70 • AX125 Dedicated (Hardwired) Array Clock Networks

Worst-Case Commercial Conditions VCCA = 1.425 V, VCCI = 3.0 V, T_J = 70°C

		-2 Speed		-1 Speed		Std Speed		Units
