### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

**Notes:**

1. Note that GTL+ 2.5 V is not supported across the full military temperature range.
2. A "✓" indicates whether standards can be used within a bank at the same time.

**Examples:**

- a) LVTTL can be used with 3.3V PCI and GTL+ (3.3V), when  $V_{REF} = 1.0V$  (GTL+ requirement).
- b) LVTTL can be used with 3.3V PCI and SSTL3 Class I and II, when  $V_{REF} = 1.5V$  (SSTL3 requirement).

Note that two I/O standards are compatible if:

- Their VCCI values are identical.
- Their VREF standards are identical (if applicable).

For example, if LVTTL 3.3 V (VREF= 1.0 V) is used, then the other available (i.e. compatible) I/O standards in the same bank are LVTTL 3.3 V PCI/PCI-X, GTL+, and LVPECL.

Also note that when multiple I/O standards are used within a bank, the voltage tolerance will be limited to the minimum tolerance of all I/O standards used in the bank.

## Routed Clocks

The routed clock (CLK) is a low-skew network that can drive the clock inputs of all sequential modules in the device (logically equivalent to the HCLK), but has the added flexibility in that it can drive the S0 (Enable), S1, PSET, and CLR input of a register (R-cells and I/O registers) as well as any of the inputs of any C-cell in the device. This allows CLks to be used not only as clocks, but also for other global signals or high fanout nets. All four CLks are available everywhere on the chip.

## CLK1 and CLK2

Both PLL outputs, CLK1 and CLK2, can be used to drive a global resource, an adjacent PLL RefCLK input, or a net in the FPGA core. Not all drive combinations are possible (Table 2-81).

**Table 2-81 • PLL General Connections Rules**

CLK1	CLK2
HCLK	HCLK
CLK	CLK
HCLK	Routed net output
Routed net output	HCLK
HCLK	NONE
NONE	HCLK
CLK	NONE
NONE	CLK

Note: *The PLL outputs remain Low when REFCLK is constant (either Low or High).*

## Restrictions on CLK1 and CLK2

- When both are driving global resources, they must be driving the same type of global resource (i.e. either HCLK or CLK).
- Only one can drive a routed net at any given time.

Table 2-82 and Table 2-83 specify all the possible CLK1 and CLK2 connections for the north and south PLLs. HCLK1 and HCLK2 are used to denote the different HCLK networks when two are being driven at the same time by a single PLL (Note that HCLK1 is the primary clock resource associated with the PLL, and HCLK2 is the clock resource associated with the adjacent PLL). Likewise, CLK1 and CLK2 are used to denote the different CLK networks when two are being driven at the same time by a single PLL (Figure 2-48 on page 2-75).

**Table 2-82 • North PLL Connections**

CLK1	CLK2
HCLK1	Routed net
HCLK1	Unused
HCLK2	HCLK1
HCLK2	Routed net
HCLK2	Both HCLK1 and routed net
HCLK2	Unused
Unused	HCLK1
Unused	Routed net
Unused	Both HCLK1 and routed net
Unused	Unused
Routed net	HCLK1
Routed net	Unused
Both HCLK1 and HCLK2	Routed net
Both HCLK1 and HCLK2	Unused
Both HCLK1 and routed net	Unusable
Both HCLK2 and routed net	HCLK1
Both HCLK2 and routed net	Unused
HCLK1, HCLK2, and routed net	Unusable

Note: *Designer software currently does not support all of these connections. Only exclusive connections where one output connects to a single net are supported at this time (e.g. CLK1 driving HCLK1, and HCLK2 is not supported).*

## Clock Skew Minimization

Figure 2-56 indicates how feedback from the clock network can be used to create minimal skew between the distributed clock network and the input clock. The input clock is fed to the reference clock input of the PLL. The output clock (CLK2) feeds a routed clock network. The feedback input to the PLL uses a clock input delayed by a routing network. The PLL then adjusts the phase of the input clock to match the delayed clock, thus providing nearly zero effective skew between the two clocks. Refer to the *Axcelerator Family PLL and Clock Management* application note for more information.

## FIFO

Every memory block has its own embedded FIFO controller. Each FIFO block has one read port and one write port. This embedded FIFO controller uses no internal FPGA logic and features:

- Glitch-free FIFO Flags
- Gray-code address counters/pointers to prevent metastability problems
- Overflow and underflow control

Both ports are configurable in various sizes from 4k x 1 to 128 x 36, similar to the RAM block size. Each port is fully synchronous.

Read and write operations can be completely independent. Data on the appropriate WD pins are written to the FIFO on every active WCLK edge as long as WEN is high. Data is read from the FIFO and output on the appropriate RD pins on every active RCLK edge as long as REN is asserted.

The FIFO block offers programmable almost-empty (AEMPTY) and almost-full (AFULL) flags as well as EMPTY and FULL flags (Figure 2-61):

- The FULL flag is synchronous to WCLK. It allows the FIFO to inhibit writing when full.
- The EMPTY flag is synchronous to RCLK. It allows the FIFO to inhibit reading at the empty condition.

Gray code counters are used to prevent metastability problems associated with flag logic. The depth of the FIFO is dependent on the data width and the number of memory blocks used to create the FIFO. The write operations to the FIFO are synchronous with respect to the WCLK, and the read operations are synchronous with respect to the RCLK.

The FIFO block may be reset to the empty state.
