### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	2016
Number of Logic Elements/Cells	-
Total RAM Bits	18432
Number of I/O	138
Number of Gates	125000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microsemi/ax125-2fgg256i">https://www.e-xfl.com/product-detail/microsemi/ax125-2fgg256i</a>

Table 2-15, Table 2-16, and Table 2-17 list all the available macro names differentiated by I/O standard, type, slew rate, and drive strength.

**Table 2-15 • Macros for Single-Ended I/O Standards**

Standard	VCCI	Macro Names
LVTTL	3.3 V	CLKBUF, HCLKBUF_INBUF, OUTBUF, OUTBUF_S_8, OUTBUF_S_12, OUTBUF_S_16, OUTBUF_S_24, OUTBUF_H_8, OUTBUF_H_12, OUTBUF_H_16, OUTBUF_H_24, TRIBUF, TRIBUF_S_8, TRIBUF_S_12, TRIBUF_S_16, TRIBUF_S_24, TRIBUF_H_8, TRIBUF_H_12, TRIBUF_H_16, TRIBUF_H_24, BIBUF, BIBUF_S_8, BIBUF_S_12, BIBUF_S_16, BIBUF_S_24, BIBUF_H_8, BIBUF_H_12, BIBUF_H_16, BIBUF_H_24
3.3 V PCI	3.3 V	CLKBUF_PCI, HCLKBUF_PCI, INBUF_PCI, OUTBUF_PCI, TRIBUF_PCI, BIBUF_PCI
3.3 V PCI-X	3.3 V	CLKBUF_PCI-X, HCLKBUF_PCI-X, INBUF_PCI-X, OUTBUF_PCI-X, TRIBUF_PCI-X, BIBUF_PCI-X
LVCMOS25	2.5 V	CLKBUF_LVCMOS25, HCLKBUF_LVCMOS25, INBUF_LVCMOS25, OUTBUF_LVCMOS25, TRIBUF_LVCMOS25, BIBUF_LVCMOS25
LVCMOS18	1.8 V	CLKBUF_LVCMOS18, HCLKBUF_LVCMOS18, INBUF_LVCMOS18, OUTBUF_LVCMOS18, TRIBUF_LVCMOS18, BIBUF_LVCMOS18
LVCMOS15 (JESD8-11)	1.5 V	CLKBUF_LVCMOS15, HCLKBUF_LVCMOS15, INBUF_LVCMOS15, OUTBUF_LVCMOS15, TRIBUF_LVCMOS15, BIBUF_LVCMOS15

**Table 2-16 • I/O Macros for Differential I/O Standards**

Standard	VCCI	Macro Names
LVPECL	3.3 V	CLKBUF_LVPECL, HCLKBUF_LVPECL, INBUF_LVPECL, OUTBUF_LVPECL
LVDS	2.5 V	CLKBUF_LVDS, HCLKBUF_LVDS, INBUF_LVDS, OUTBUF_LVDS

**Table 2-17 • I/O Macros for Voltage-Referenced I/O Standards**

Standard	VCCI	VREF	Macro Names
GTL+	3.3 V	1.0 V	CLKBUF_GTP33, HCLKBUF_GTP33, INBUF_GTP33, OUTBUF_GTP33, TRIBUF_GTP33, BIBUF_GTP33
GTL+	2.5 V	1.0 V	CLKBUF_GTP25, HCLKBUF_GTP25, INBUF_GTP25, OUTBUF_GTP25, TRIBUF_GTP25, BIBUF_GTP25
SSTL2 Class I	2.5 V	1.25 V	CLKBUF_SSTL2_I, HCLKBUF_SSTL2_I, INBUF_SSTL2_I, OUTBUF_SSTL2_I, TRIBUF_SSTL2_I, BIBUF_SSTL2_I
SSTL2 Class II	2.5 V	1.25 V	CLKBUF_SSTL2_II, HCLKBUF_SSTL2_II, INBUF_SSTL2_II, OUTBUF_SSTL2_II, TRIBUF_SSTL2_II, BIBUF_SSTL2_II
SSTL3 Class I	3.3 V	1.5 V	CLKBUF_SSTL3_I, HCLKBUF_SSTL3_I, INBUF_SSTL3_I, OUTBUF_SSTL3_I, TRIBUF_SSTL3_I, BIBUF_SSTL3_I
SSTL3 Class II	3.3 V	1.5 V	CLKBUF_SSTL3_II, HCLKBUF_SSTL3_II, INBUF_SSTL3_II, OUTBUF_SSTL3_II, TRIBUF_SSTL3_II, BIBUF_SSTL3_II

## Differential Standards

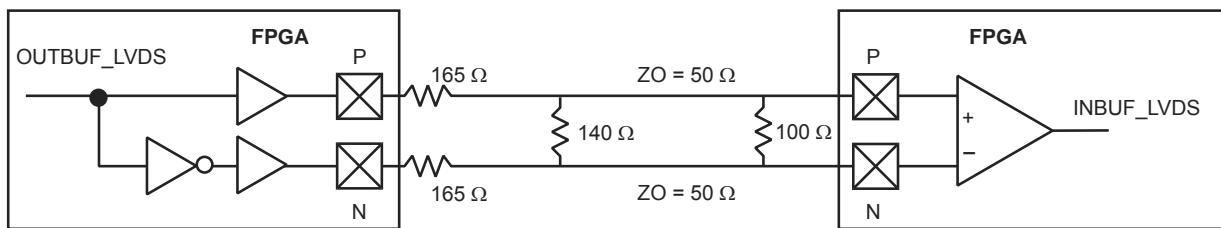

### Physical Implementation

Implementing differential I/O standards requires the configuration of a pair of external I/O pads, resulting in a single internal signal. To facilitate construction of the differential pair, a single I/O Cluster contains the resources for a pair of I/Os. Configuration of the I/O Cluster as a differential pair is handled by Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with these standards.

### LVDS

Low-Voltage Differential Signal (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit is carried through two signal lines, so two pins are needed. It also requires an external resistor termination. The voltage swing between these two signal lines is approximately 350 mV.

**Figure 2-25 • LVDS Board-Level Implementation**

The LVDS circuit consists of a differential driver connected to a terminated receiver through a constant-impedance transmission line. The receiver is a wide-common-mode-range differential amplifier. The common-mode range is from 0.2 V to 2.2 V for a differential input with 400 mV swing.

To implement the driver for the LVDS circuit, drivers from two adjacent I/O cells are used to generate the differential signals (note that the driver is not a current-mode driver). This driver provides a nominal constant current of 3.5 mA. When this current flows through a 100  $\Omega$  termination resistor on the receiver side, a voltage swing of 350 mV is developed across the resistor. The direction of the current flow is controlled by the data fed to the driver.

An external-resistor network (three resistors) is needed to reduce the voltage swing to about 350 mV. Therefore, four external resistors are required, three for the driver and one for the receiver.

**Table 2-56 • DC Input and Output Levels**

DC Parameter	Description	Min.	Typ.	Max.	Units
VCCI <sup>1</sup>	Supply Voltage	2.375	2.5	2.625	V
VOH	Output High Voltage	1.25	1.425	1.6	V
VOL	Output Low Voltage	0.9	1.075	1.25	V
VODIFF	Differential Output Voltage	250	350	450	mV
VOCM	Output Common Mode Voltage	1.125	1.25	1.375	V
VICM2	Input Common Mode Voltage	0.2	1.25	2.2	V

Notes:

1.  $\pm 5\%$
2. Differential input voltage =  $\pm 350$  mV.

# Module Specifications

## C-Cell

### Introduction

The C-cell is one of the two logic module types in the AX architecture. It is the combinatorial logic resource in the Axcelerator device. The AX architecture implements a new combinatorial cell that is an extension of the C-cell implemented in the SX-A family. The main enhancement of the new C-cell is the addition of carry-chain logic.

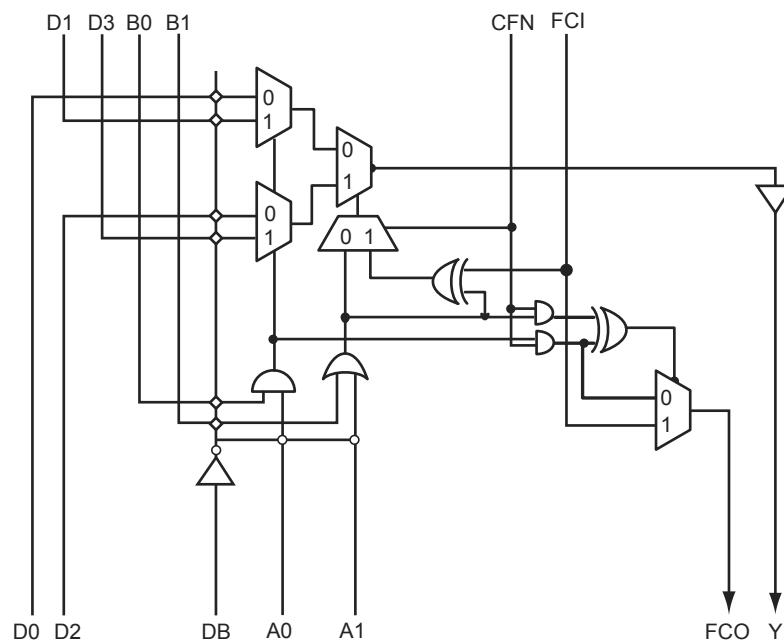

The C-cell can be used in a carry-chain mode to construct arithmetic functions. If carry-chain logic is not required, it can be disabled.

The C-cell features the following (Figure 2-27):

- Eight-input MUX (data: D0-D3, select: A0, A1, B0, B1). User signals can be routed to any one of these inputs. Any of the C-cell inputs (D0-D3, A0, A1, B0, B1) can be tied to one of the four routed clocks (CLKE/F/G/H).
- Inverter (DB input) can be used to drive a complement signal of any of the inputs to the C-cell.
- A carry input and a carry output. The carry input signal of the C-cell is the carry output from the C-cell directly to the north.
- Carry connect for carry-chain logic with a signal propagation time of less than 0.1 ns.
- A hardwired connection (direct connect) to the adjacent R-cell (Register Cell) for all C-cells on the east side of a SuperCluster with a signal propagation time of less than 0.1 ns.

This layout of the C-cell (and the C-cell Cluster) enables the implementation of over 4,000 functions of up to five bits. For example, two C-cells can be used together to implement a four-input XOR function in a single cell delay.

The carry-chain configuration is handled automatically for the user with Microsemi's extensive macro library (please see the *Antifuse Macro Library Guide* for a complete listing of available Axcelerator macros).

**Figure 2-27 • C-Cell**

## Timing Model and Waveforms

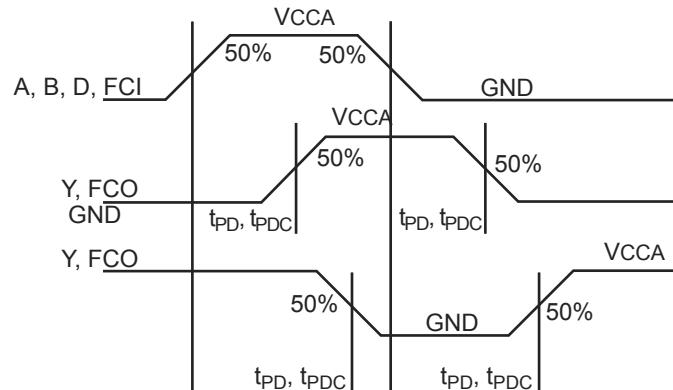

Figure 2-28 • C-Cell Timing Model and Waveforms

### Timing Characteristics

Table 2-62 • C-Cell

Worst-Case Commercial Conditions VCCA = 1.425 V, VCCI = 3.0 V, T<sub>J</sub> = 70°C

Parameter	Description	-2 Speed		-1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
<b>C-Cell Propagation Delays</b>								
t <sub>PD</sub>	Any input to output Y	0.74		0.84		0.99		ns
t <sub>PDC</sub>	Any input to carry chain output (FCO)	0.57		0.64		0.76		ns
t <sub>PDB</sub>	Any input through DB when one input is used	0.95		1.09		1.28		ns
t <sub>CCY</sub>	Input to carry chain (FCI) to Y	0.61		0.69		0.82		ns
t <sub>CC</sub>	Input to carry chain (FCI) to carry chain output (FCO)	0.08		0.09		0.11		ns

## CLK1 and CLK2

Both PLL outputs, CLK1 and CLK2, can be used to drive a global resource, an adjacent PLL RefCLK input, or a net in the FPGA core. Not all drive combinations are possible (Table 2-81).

**Table 2-81 • PLL General Connections Rules**

CLK1	CLK2
HCLK	HCLK
CLK	CLK
HCLK	Routed net output
Routed net output	HCLK
HCLK	NONE
NONE	HCLK
CLK	NONE
NONE	CLK

Note: *The PLL outputs remain Low when REFCLK is constant (either Low or High).*

## Restrictions on CLK1 and CLK2

- When both are driving global resources, they must be driving the same type of global resource (i.e. either HCLK or CLK).
- Only one can drive a routed net at any given time.

Table 2-82 and Table 2-83 specify all the possible CLK1 and CLK2 connections for the north and south PLLs. HCLK1 and HCLK2 are used to denote the different HCLK networks when two are being driven at the same time by a single PLL (Note that HCLK1 is the primary clock resource associated with the PLL, and HCLK2 is the clock resource associated with the adjacent PLL). Likewise, CLK1 and CLK2 are used to denote the different CLK networks when two are being driven at the same time by a single PLL (Figure 2-48 on page 2-75).

**Table 2-82 • North PLL Connections**

CLK1	CLK2
HCLK1	Routed net
HCLK1	Unused
HCLK2	HCLK1
HCLK2	Routed net
HCLK2	Both HCLK1 and routed net
HCLK2	Unused
Unused	HCLK1
Unused	Routed net
Unused	Both HCLK1 and routed net
Unused	Unused
Routed net	HCLK1
Routed net	Unused
Both HCLK1 and HCLK2	Routed net
Both HCLK1 and HCLK2	Unused
Both HCLK1 and routed net	Unusable
Both HCLK2 and routed net	HCLK1
Both HCLK2 and routed net	Unused
HCLK1, HCLK2, and routed net	Unusable

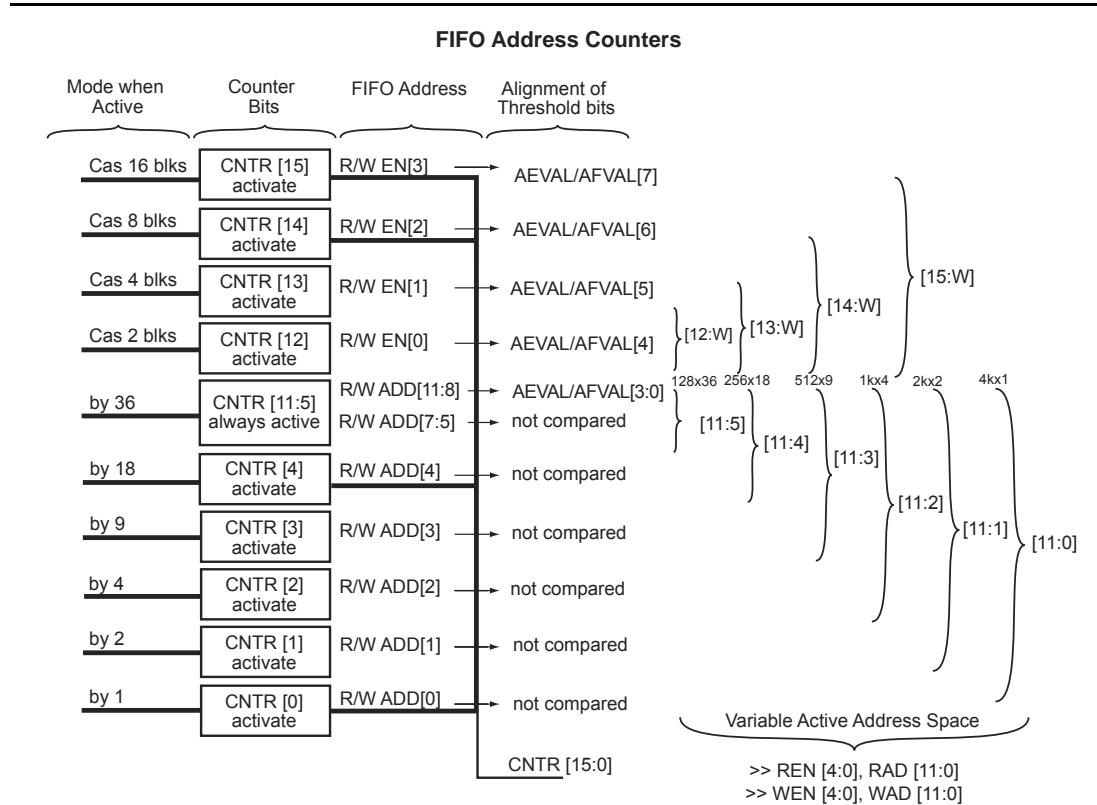

Note: *Designer software currently does not support all of these connections. Only exclusive connections where one output connects to a single net are supported at this time (e.g. CLK1 driving HCLK1, and HCLK2 is not supported).*

## FIFO Flag Logic

The FIFO is user configurable into various DEPTHS and WIDTHs. Figure 2-62 shows the FIFO address counter details.

- Bits 11 to 5 are active for all modes.
- As the data word size is reduced, more least-significant bits are added to the address.
- As the number of cascaded blocks increases, the number of significant bits in the address increases.

For example, if four blocks are cascaded as a 1kx16 FIFO with each block having a 1kx4 aspect ratio, bits 11 to 2 of the address will be used to specify locations within each RAM block, whereas bits 13 and 12 will be used to specify the RAM block.

Note: Inactive counter bits are set to zero.

**Figure 2-62 • FIFO Address Counters**

The AFULL and AEMPTY flag threshold values are programmable. The threshold values are AFVAL and AEVAL, respectively. Although the trigger threshold for each flag is defined with eight bits, the effective number of threshold bits in the comparison depends on the configuration. The effective number of threshold bits corresponds to the range of active bits in the FIFO address space (Table 2-94).

**Table 2-94 • FIFO Flag Logic**

Mode	Inactive AEVAL/AFVAL Bits	Inactive DIFF Bits (set to 0)	DIFF Comparison to AFVAL/AEVAL
Non-cascade	[7:4]	[15:12]	DIFF[11:8] with AE/FVAL[3:0]
Cascade 2 blocks	[7:5]	[15:13]	DIFF[12:8] with AE/FVAL[4:0]
Cascade 4 blocks	[7:6]	[15:14]	DIFF[13:8] with AE/FVAL[5:0]
Cascade 8 blocks	[7]	[15]	DIFF[14:8] with AE/FVAL[6:0]
Cascade 16 blocks	None	None	DIFF[15:8] with AE/FVAL[7:0]

## Glitch Elimination

An analog filter is added to each FIFO controller to guarantee glitch-free FIFO-flag logic.

## Overflow and Underflow Control

The counter MSB keeps track of the difference between the read address (RA) and the write address (WA). The EMPTY flag is set when the read and write addresses are equal. To prevent underflow, the write address is double-sampled by the read clock prior to comparison with the read address (part A in Figure 2-64). To prevent overflow, the read address is double-sampled by the write clock prior to comparison to the write address (part B in Figure 2-64).

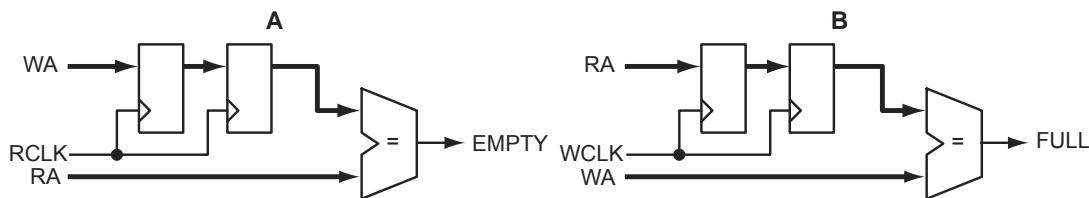

Figure 2-64 • Overflow and Underflow Control

## FIFO Configurations

Unlike the RAM, the FIFO's write width and read width cannot be specified independently. For the FIFO, the write and read widths must be the same. The WIDTH pins are used to specify one of six allowable word widths, as shown in Table 2-96.

Table 2-96 • FIFO Width Configurations

WIDTH(2:0)	W x D
000	1 x 4k
001	2 x 2k
010	4 x 1k
011	9 x 512
100	18 x 256
101	36 x 128
11x	reserved

The DEPTH pins allow RAM cells to be cascaded to create larger FIFOs. The four pins allow depths of 2, 4, 8, and 16 to be specified. Table 2-86 on page 2-87 describes the FIFO depth options for various data width and memory blocks.

## Interface

Figure 2-65 on page 2-99 shows a logic block diagram of the Axcelerator FIFO module.

## Cascading FIFO Blocks

FIFO blocks can be cascaded to create deeper FIFO functions. When building larger FIFO blocks, if the word width can be fractured in a multi-bit FIFO, the fractured word configuration is recommended over a cascaded configuration. For example, 256x36 can be configured as two blocks of 256x18. This should be taken into account when building the FIFO blocks manually. However, when using SmartGen, the user only needs to specify the depth and width of the necessary FIFO blocks. SmartGen automatically configures these blocks to optimize performance.

## 4 – Datasheet Information

---

### List of Changes

The following table lists critical changes that were made in the current version of the document.

Revision	Changes	Page
Revision 18 (March 2012)	Table 2-1 • Absolute Maximum Ratings was updated to correct the maximum DC core supply voltage (VCCA) from 1.6 V to 1.7 V (SAR 36786). The maximum input voltage (VI) was corrected from 3.75 V to 4.1 V (SAR 35419).	2-1
	Values for tristate leakage current IOZ, and I <sub>IIH</sub> and I <sub>IIL</sub> were added to Table 2-3 • Standby Current (SARs 35774, 32021).	2-2
	Figure 2-2 • VCCPLX and VCOMPLX Power Supply Connect was updated to correct the units for the resistance from "W" to $\Omega$ (SAR 36415).	2-9
	In the Introduction to the "User I/Os" section, the following sentence was added to clarify the slew rate setting (SAR 34943):  The slew rate setting is effective for both rising and falling edges.	2-11
	Figure 2-3 • Use of an External Resistor for 5 V Tolerance was revised to show the VCCI and GND clamp diodes. The explanatory text above the figure was revised as well (SAR 34942).	2-13
	EQ 3 for 5 V tolerance was corrected to change Vdiode from 0.6 V to 0.7 V (SAR 36786).	2-13
	Additional information was added to the "Using the Weak Pull-Up and Pull-Down Circuits" section to clarify how the weak pull-up and pull-down resistors are physically implemented (SAR 34945).	2-17
	The description for the C <sub>INCLK</sub> parameter in Table 2-18 • Input Capacitance was changed from "Input capacitance on clock pin" to "Input capacitance on HCLK and RCLK pin" (SAR 34944).	2-21
	Table 2-19 • I/O Input Rise Time and Fall Time* is new (SAR 34942).	2-21
	The minimum VIL for 1.5 V LVCMOS and PCI was corrected from -0.5 to -0.3 in Table 2-29 • DC Input and Output Levels and Table 2-33 • DC Input and Output Levels (SAR 34358).	2-38, 2-40
Revision 17 (September 2011)	Support for simulating the GCLR/ GPSET feature in the Axcelerator Family was added in Libero software v9.0 SPI11. Reference to the section explaining this in the <i>Antifuse Macro Library Guide</i> was added to the "R-Cell" section (SAR 26413).	2-58
	The enable signal in Figure 2-32 • R-Cell Delays was corrected to show it is active low rather than active high (SAR 34946).	2-59
	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "Axcelerator Family Device Status" table indicates the status for each device in the device family.	iii
	The "Features" section, "Programmable Interconnect Element" section, and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865).	i, 1-1, 2-108
