Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	32256
Number of Logic Elements/Cells	-
Total RAM Bits	294912
Number of I/O	198
Number of Gates	2000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TA)
Package / Case	352-BFCQFP with Tie Bar
Supplier Device Package	352-CQFP (75x75)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax2000-cq352m

3.3 V PCI, 3.3 V PCI-X

Peripheral Component Interface for 3.3 V standard specifies support for both 33 MHz and 66 MHz PCI bus applications. It uses an LVTTTL input buffer and a push-pull output buffer. The input and output buffers are 5 V tolerant with the aid of external components. Axcelerator 3.3 V PCI and 3.3 V PCI-X buffers are compliant with the PCI Local Bus Specification Rev. 2.1.

The PCI Compliance Specification requires the clamp diodes to be able to withstand for 11 ns, -3.5 V in undershoot, and 7.1 V in overshoot.

Table 2-33 • DC Input and Output Levels

	VIL		VIH		VOL	VOH	IOL	IOH
	Min., V	Max., V	Min., V	Max., V	Max., V	Min., V	mA	mA
PCI	-0.3	0.3 VCCI	0.5 VCCI	VCCI + 0.5	(per PCI specification)			
PCI-X	-0.5	0.35 VCCI	0.5 VCCI	VCCI + 0.5	(per PCI specification)			

AC Loadings

Worst-Case Commercial Conditions $VCCA = 1.425\text{ V}$, $VCCI = 3.0\text{ V}$, $T_J = 70^\circ\text{C}$

Parameter	Description	-2 Speed		-1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
C-Cell Propagation Delays								
t_{PD}	Any input to output Y		0.74		0.84		0.99	ns
t_{PDC}	Any input to carry chain output (FCO)		0.57		0.64		0.76	ns
t_{PDB}	Any input through DB when one input is used		0.95		1.09		1.28	ns
t_{CCY}	Input to carry chain (FCI) to Y		0.61		0.69		0.82	ns
t_{CC}	Input to carry chain (FCI) to carry chain output (FCO)		0.08		0.09		0.11	ns

Vertical and Horizontal Routing

Vertical and Horizontal Tracks provide both local and long distance routing (Figure 2-37 on page 2-62). These tracks are composed of both short-distance, segmented routing and across-chip routing tracks (segmented at core tile boundaries). The short-distance, segmented routing resources can be concatenated through antifuse connections to build longer routing tracks.

These short-distance routing tracks can be used within and between SuperClusters or between modules of non-adjacent SuperClusters. They can be connected to the Output Tracks and to any logic module input (R-cell, C-cell, Buffer, and TX module).

The across-chip horizontal and vertical routing provides long-distance routing resources. These resources interface with the rest of the routing structures through the RX and TX modules (Figure 2-37). The RX module is used to drive signals from the across-chip horizontal and vertical routing to the Output Tracks within the SuperCluster. The TX module is used to drive vertical and horizontal across-chip routing from either short-distance horizontal tracks or from Output Tracks. The TX module can also be used to drive signals from vertical across-chip tracks to horizontal across-chip tracks and vice versa.

single-ended, or voltage-referenced standard. The [H]CLKxN pad can only be used as a differential pair with [H]CLKxP.

The block marked “i Delay Match” is a fixed delay equal to that of the i divider. The “j Delay Match” block has the same function as its j divider counterpart.

Functional Description

Figure 2-48 on page 2-75 illustrates a block diagram of the PLL. The PLL contains two dividers, i and j, that allow frequency scaling of the clock signal:

- The i divider in the feedback path allows multiplication of the input clock by integer factors ranging from 1 to 64, and the resultant frequency is available at the output of the PLL block.
- The j divider divides the PLL output by integer factors ranging from 1 to 64, and the divided clock is available at CLK1.
- The two dividers together can implement any combination of multiplication and division up to a maximum frequency of 1 GHz on CLK1. Both the CLK1 and CLK2 outputs have a fixed 50/50 duty cycle.
- The output frequencies of the two clocks are given by the following formulas (f_{REF} is the reference clock frequency):

$$f_{CLK1} = f_{REF} * (DividerI) / (DividerJ)$$

EQ 4

$$f_{CLK2} = f_{REF} * (DividerI)$$

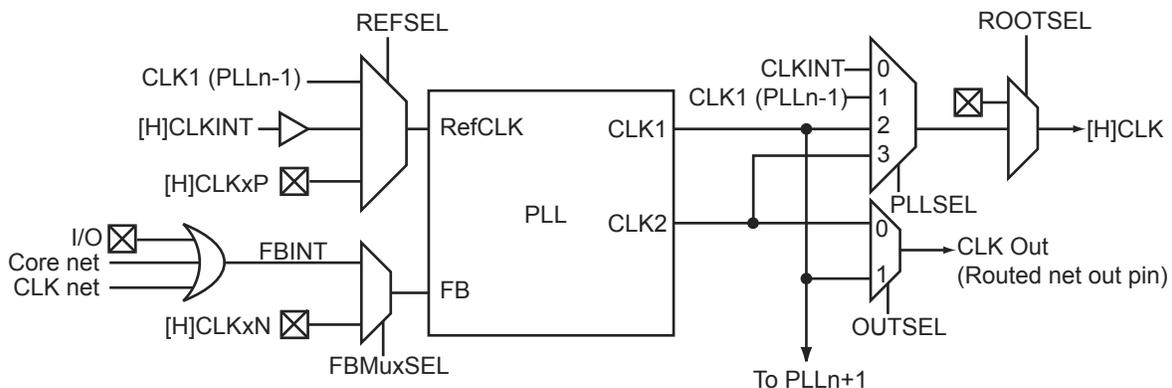

EQ 5

- CLK2 provides the PLL output directly—without division

The input and output frequency ranges are selected by LowFreq and Osc(2:0), respectively. These functions and their possible values are detailed in Table 2-80 on page 2-77.

The delay lines shown in Figure 2-48 on page 2-75 are programmable. The feedback clock path can be delayed (using the five DelayLine bits) relative to the reference clock (or vice versa) by up to 3.75 ns in increments of 250 ps. Table 2-80 on page 2-77 describes the usage of these bits. The delay increments are independent of frequency, so this results in phase changes that vary with frequency. The delay value is highly dependent on V_{CC} and the speed grade.

Figure 2-49 is a logical diagram of the various control signals to the PLL and shows how the PLL interfaces with the global and routing networks of the FPGA. Note that not all signals are user-accessible. These non-user-accessible signals are used by the place-and-route tool to control the configuration of the PLL. The user gains access to these control signals either based upon the connections built in the user's design or through the special macros (Table 2-84 on page 2-81) inserted into the design. For example, connecting the macro PLLOUT to CLK2 will control the OUTSEL signal.

Note: Not all signals are available to the user.

Figure 2-49 • PLL Logical Interface

RAM

Each memory block consists of 4,608 bits that can be organized as 128x36, 256x18, 512x9, 1kx4, 2kx2, or 4kx1 and are cascadable to create larger memory sizes. This allows built-in bus width conversion (Table 2-86). Each block has independent read and write ports which enable simultaneous read and write operations.

Table 2-86 • Memory Block WxD Options

Data-word (in bits)	Depth	Address Bus	Data Bus
1	4,096	RA/WA[11:0]	RD/WD[0]
2	2,048	RA/WA[10:0]	RD/WD[1:0]
4	1,024	RA/WA[9:0]	RD/WD[3:0]
9	512	RA/WA[8:0]	RD/WD[8:0]
18	256	RA/WA[7:0]	RD/WD[17:0]
36	128	RA/WA[6:0]	RD/WD[35:0]

Clocks

The RCLK and the WCLK have independent source polarity selection and can be sourced by any global or local signal.

RAM Configurations

The AX architecture allows the read side and write side of RAMs to be organized independently, allowing for bus conversion. For example, the write side can be set to 256x18 and the read side to 512x9.

Both the write width and read width for the RAM blocks can be specified independently and changed dynamically with the WW (write width) and RW (read width) pins. The D x W different configurations are: 128 x 36, 256 x 18, 512 x 9, 1k x 4, 2k x 2, and 4k x 1. The allowable RW and WW values are shown in Table 2-87.

Table 2-87 • Allowable RW and WW Values

RW(2:0)	WW(2:0)	D x W
000	000	4k x 1
001	001	2k x 2
010	010	1k x 4
011	011	512 x 9
100	100	256 x 18
101	101	128 x 36
11x	11x	reserved

When widths of one, two, and four are selected, the ninth bit is unused. For example, when writing nine-bit values and reading four-bit values, only the first four bits and the second four bits of each nine-bit value are addressable for read operations. The ninth bit is not accessible. Conversely, when writing four-bit values and reading nine-bit values, the ninth bit of a read operation will be undefined.

FIFO

Every memory block has its own embedded FIFO controller. Each FIFO block has one read port and one write port. This embedded FIFO controller uses no internal FPGA logic and features:

- Glitch-free FIFO Flags
- Gray-code address counters/pointers to prevent metastability problems
- Overflow and underflow control

Both ports are configurable in various sizes from 4k x 1 to 128 x 36, similar to the RAM block size. Each port is fully synchronous.

Read and write operations can be completely independent. Data on the appropriate WD pins are written to the FIFO on every active WCLK edge as long as WEN is high. Data is read from the FIFO and output on the appropriate RD pins on every active RCLK edge as long as REN is asserted.

The FIFO block offers programmable almost-empty (AEMPTY) and almost-full (AFULL) flags as well as EMPTY and FULL flags (Figure 2-61):

- The FULL flag is synchronous to WCLK. It allows the FIFO to inhibit writing when full.
- The EMPTY flag is synchronous to RCLK. It allows the FIFO to inhibit reading at the empty condition.

Gray code counters are used to prevent metastability problems associated with flag logic. The depth of the FIFO is dependent on the data width and the number of memory blocks used to create the FIFO. The write operations to the FIFO are synchronous with respect to the WCLK, and the read operations are synchronous with respect to the RCLK.

The FIFO block may be reset to the empty state.

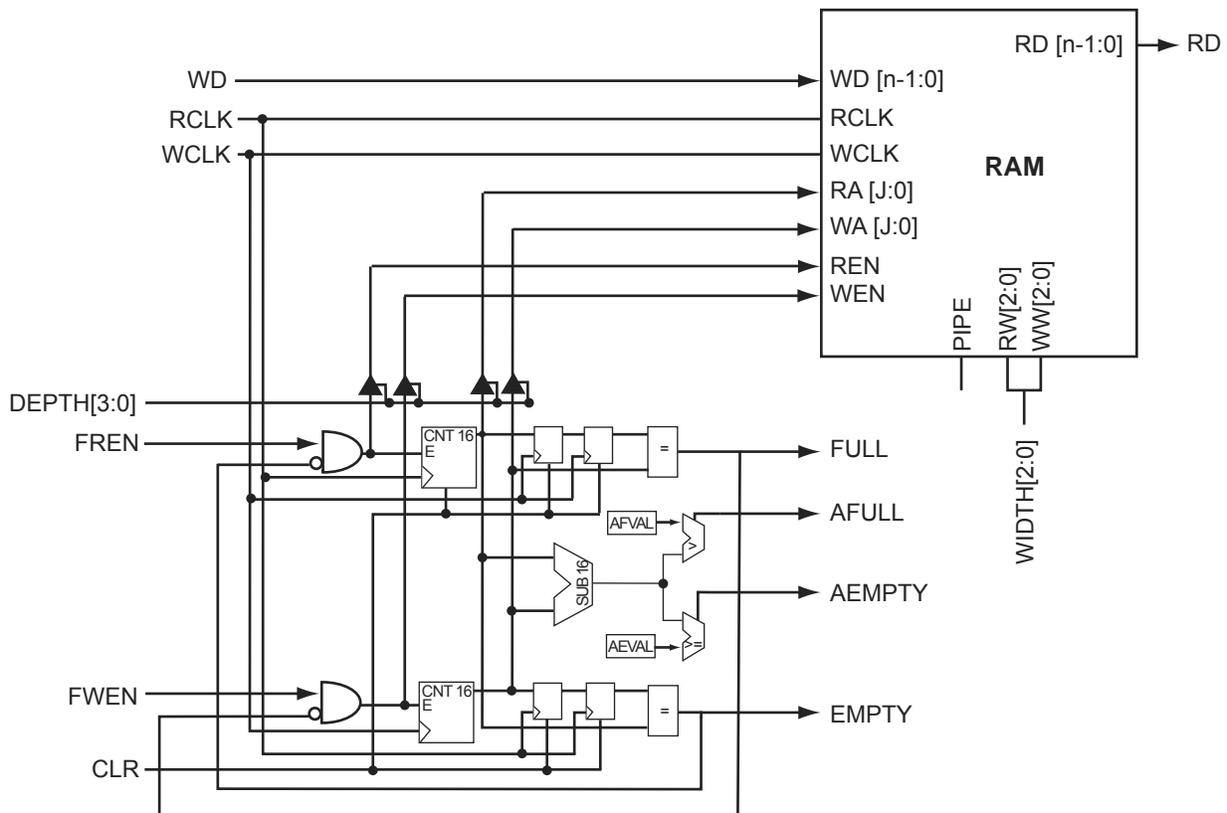

Figure 2-61 • Axcelerator RAM with Embedded FIFO Controller

mode if desired. Please note, if the I/O bank is not disabled, differential I/Os belonging to the I/O bank will still consume normal power, even when operating in the low power mode.

The Axcelerator device will resume normal operation 10 μ s after the LP pin is pulled Low.

To further reduce power consumption, the internal charge pump can be bypassed and an external power supply voltage can be used instead. This saves the internal charge-pump operating current, resulting in no DC current draw. The Axcelerator family devices have a dedicated "V_{PUMP}" pin that can be used to access an external charge pump device. In normal chip operation, when using the internal charge pump, V_{PUMP} should be tied to GND. When the voltage level on V_{PUMP} is set to 3.3V, the internal charge pump is turned off, and the V_{PUMP} voltage will be used as the charge pump voltage. Adequate voltage regulation (i.e. high drive, low output impedance, and good decoupling) should be used at V_{PUMP}.

In addition, any PLL in use can be powered down to further reduce power consumption. This can be done with the PowerDown pin driven Low. Driving this pin High restarts the PLL with the output clock(s) being stable once lock is restored.

JTAG

Axcelerator offers a JTAG interface that is compliant with the IEEE 1149.1 standard. The user can employ the JTAG interface for probing a design and performing any JTAG Public Instructions as defined in the Table 2-103.

Table 2-103 • JTAG Instruction Code

Instruction (IR4:IR0)	Binary Code
Extest	00000
Preload / Sample	00001
Intest	00010
USERCODE	00011
IDCODE	00100
HIGHZ	01110
CLAMP	01111
Diagnostic	10000
Reserved	All others
Bypass	11111

Interface

The interface consists of four inputs: Test Mode Select (TMS), Test Data In (TDI), Test Clock (TCK), TAP Controller Reset (TRST), and an output, Test Data Out (TDO). TMS, TDI, and TRST have on-chip pull-up resistors.

TRST

TRST (Test-Logic Reset) is an active-low, asynchronous reset signal to the TAP controller. The TRST input can be used to reset the Test Access Port (TAP) Controller to the TRST state. The TAP Controller can be held at this state permanently by grounding the TRST pin. To hold the JTAG TAP controller in the TRST state, it is recommended to connect TRST to ground via a 1 k Ω resistor.

There is an optional internal pull-up resistor available for the TRST input that can be set by the user at programming. Care should be exercised when using this option in combination with an external tie-off to ground.

An on-chip power-on-reset (POWRST) circuit is included. POWRST has the same function as "TRST," but it only occurs at power-up or during recovery from a VCCA and/or VCCDA voltage drop.

4 – Datasheet Information

List of Changes

The following table lists critical changes that were made in the current version of the document.

Revision	Changes	Page
Revision 18 (March 2012)	Table 2-1 • Absolute Maximum Ratings was updated to correct the maximum DC core supply voltage (VCCA) from 1.6 V to 1.7 V (SAR 36786). The maximum input voltage (VI) was corrected from 3.75 V to 4.1 V (SAR 35419).	2-1
	Values for tristate leakage current IOZ, and IIH and IIL were added to Table 2-3 • Standby Current (SARs 35774, 32021).	2-2
	Figure 2-2 • VCCPLX and VCOMPLX Power Supply Connect was updated to correct the units for the resistance from "W" to Ω (SAR 36415).	2-9
	In the Introduction to the "User I/Os" section, the following sentence was added to clarify the slew rate setting (SAR 34943): The slew rate setting is effective for both rising and falling edges.	2-11
	Figure 2-3 • Use of an External Resistor for 5 V Tolerance was revised to show the VCCI and GND clamp diodes. The explanatory text above the figure was revised as well (SAR 34942).	2-13
	EQ 3 for 5 V tolerance was corrected to change Vdiode from 0.6 V to 0.7 V (SAR 36786).	2-13
	Additional information was added to the "Using the Weak Pull-Up and Pull-Down Circuits" section to clarify how the weak pull-up and pull-down resistors are physically implemented (SAR 34945).	2-17
	The description for the C _{INCLK} parameter in Table 2-18 • Input Capacitance was changed from "Input capacitance on clock pin" to "Input capacitance on HCLK and RCLK pin" (SAR 34944).	2-21
	Table 2-19 • I/O Input Rise Time and Fall Time* is new (SAR 34942).	2-21
	The minimum VIL for 1.5 V LVCMOS and PCI was corrected from –0.5 to –0.3 in Table 2-29 • DC Input and Output Levels and Table 2-33 • DC Input and Output Levels (SAR 34358).	2-38, 2-40
	Support for simulating the GCLR/ GPSET feature in the Axcelerator Family was added in Libero software v9.0 SP11. Reference to the section explaining this in the <i>Antifuse Macro Library Guide</i> was added to the "R-Cell" section (SAR 26413).	2-58
The enable signal in Figure 2-32 • R-Cell Delays was corrected to show it is active low rather than active high (SAR 34946).	2-59	
Revision 17 (September 2011)	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "Axcelerator Family Device Status" table indicates the status for each device in the device family.	iii
	The "Features" section, "Programmable Interconnect Element" section, and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865).	i, 1-1, 2-108
