### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Active
Number of LABs/CLBs	32256
Number of Logic Elements/Cells	-
Total RAM Bits	294912
Number of I/O	586
Number of Gates	2000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	896-BGA
Supplier Device Package	896-FBGA (31x31)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/ax2000-fg896">https://www.e-xfl.com/product-detail/microchip-technology/ax2000-fg896</a>

**Figure 1-8 • AX Routing Structures**

## Global Resources

Each family member has three types of global signals available to the designer: HCLK, CLK, and GCLR/GPSET. There are four hardwired clocks (HCLK) per device that can directly drive the clock input of each R-cell. Each of the four routed clocks (CLK) can drive the clock, clear, preset, or enable pin of an R-cell or any input of a C-cell (Figure 1-3 on page 1-2).

Global clear (GCLR) and global preset (GPSET) drive the clear and preset inputs of each R-cell as well as each I/O Register on a chip-wide basis at power-up.

Each HCLK and CLK has an associated analog PLL (a total of eight per chip). Each embedded PLL can be used for clock delay minimization, clock delay adjustment, or clock frequency synthesis. The PLL is capable of operating with input frequencies ranging from 14 MHz to 200 MHz and can generate output frequencies between 20 MHz and 1 GHz. The clock can be either divided or multiplied by factors ranging from 1 to 64. Additionally, multiply and divide settings can be used in any combination as long as the resulting clock frequency is between 20 MHz and 1 GHz. Adjacent PLLs can be cascaded to create complex frequency combinations.

The PLL can be used to introduce either a positive or a negative clock delay of up to 3.75 ns in 250 ps increments. The reference clock required to drive the PLL can be derived from three sources: external input pad (either single-ended or differential), internal logic, or the output of an adjacent PLL.

## Low Power (LP) Mode

The AX architecture was created for high-performance designs but also includes a low power mode (activated via the LP pin). When the low power mode is activated, I/O banks can be disabled (inputs disabled, outputs tristated), and PLLs can be placed in a power-down mode. All internal register states are maintained in this mode. Furthermore, individual I/O banks can be configured to opt out of the LP mode, thereby giving the designer access to critical signals while the rest of the chip is in low power mode.

The power can be further reduced by providing an external voltage source ( $V_{PUMP}$ ) to the device to bypass the internal charge pump (See "Low Power Mode" on page 2-106 for more information).

$$P_{outputs} = P_{I/O} * po * F_{po}$$

$C_{load}$  = the output load (technology dependent)  
 $V_{CCI}$  = the output voltage (technology dependent)  
 $po$  = the number of outputs  
 $F_{po}$  = the average output frequency

$$P_{memory} = P11 * N_{block} * FRCLK + P12 * N_{block} * FWCLK$$

$N_{block}$  = the number of RAM/FIFO blocks (1 block = 4k)  
 $F_{RCLK}$  = the read-clock frequency of the memory  
 $F_{WCLK}$  = the write-clock frequency of the memory

$$P_{PLL} = P13 * FCLK$$

$F_{RefCLK}$  = the clock frequency of the clock input of the PLL  
 $F_{CLK}$  = the clock frequency of the first clock output of the PLL

## Power Estimation Example

This example employs an AX1000 shift-register design with 1,080 R-cells, one C-cell, one reset input, and one LVTTL 12 mA output, with high slew.

This design uses one HCLK at 100 MHz.

$ms$  = 1,080 (in a shift register - 100% of R-cells are toggling at each clock cycle)

$F_s$  = 100 MHz

$s$  = 1080

=>  $P_{HCLK} = (P1 + P2 * s + P3 * \sqrt{s}) * F_s = 79 \text{ mW}$   
and  $F_s = 100 \text{ MHz}$

=>  $P_{R\text{-cells}} = P7 * ms * F_s = 173 \text{ mW}$

$mc$  = 1 (1 C-cell in this shift-register)  
and  $F_s = 100 \text{ MHz}$

=>  $P_{C\text{-cells}} = P8 * mc * F_s = 0.14 \text{ mW}$

$F_{pi} \sim 0 \text{ MHz}$

and  $pi = 1$  (1 reset input => this is why  $F_{pi}=0$ )

=>  $P_{inputs} = P9 * pi * F_{pi} = 0 \text{ mW}$

$F_{po} = 50 \text{ MHz}$

and  $po = 1$

=>  $P_{outputs} = P_{I/O} * po * F_{po} = 27.10 \text{ mW}$

No RAM/FIFO in this shift-register

=>  $P_{memory} = 0 \text{ mW}$

No PLL in this shift-register

=>  $P_{PLL} = 0 \text{ mW}$

$$P_{ac} = P_{HCLK} + P_{CLK} + P_{R\text{-cells}} + P_{C\text{-cells}} + P_{inputs} + P_{outputs} + P_{memory} + P_{PLL} = 276 \text{ mW}$$

$$P_{dc} = 7.5 \text{ mA} * 1.5 \text{ V} = 11.25 \text{ mW}$$

$$P_{total} = P_{dc} + P_{ac} = 11.25 \text{ mW} + 276 \text{ mW} = 290.30 \text{ mW}$$

## Global Resource Distribution

At the root of each global resource is a PLL. There are two groups of four PLLs for every device. One group, located at the center of the north edge (in the I/O ring) of the chip, sources the four HCLKs. The second group, located at the center of the south edge (again in the I/O ring), sources the four CLKS (Figure 2-38).

Regardless of the type of global resource, HCLK or CLK, each of the eight resources reach the ClockTileDist (CTD) Cluster located at the center of every core tile with zero skew. From the ClockTileDist Cluster, all four HCLKs and four CLKS are distributed through the core tile (Figure 2-39).

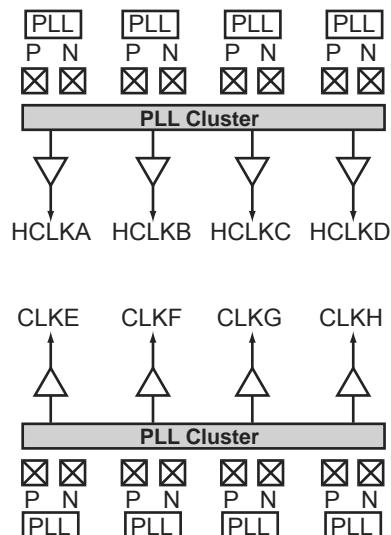

Figure 2-38 • PLL Group

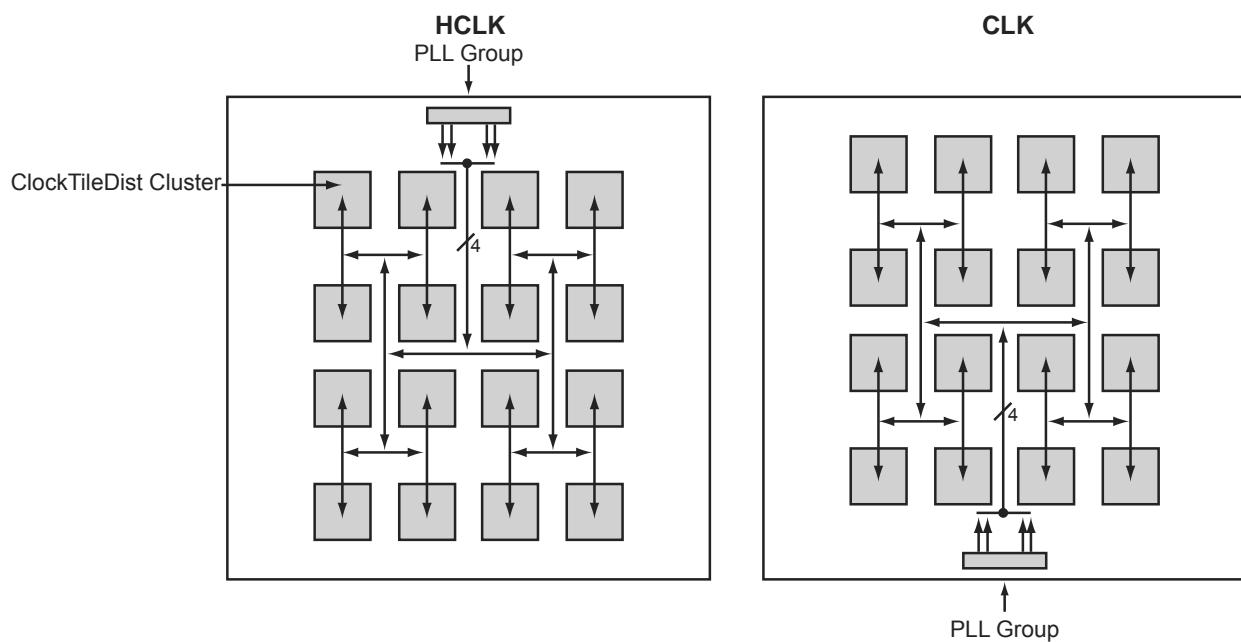

Figure 2-39 • Example of HCLK and CLK Distributions on the AX2000

The HM and CM modules can select between:

- The HCLK or CLK source respectively
- A local signal routed on generic routing resources

This allows each core tile to have eight clocks independent of the other core tiles in the device.

Both HCLK and CLK are segmentable, meaning that individual branches of the global resource can be used independently.

Like the HM and CM modules, the HD and RD modules can select between:

- The HCLK or CLK source from the HM or CM module respectively
- A local signal routed on generic routing resources

The AX architecture is capable of supporting a large number of local clocks—24 segments per HCLK driving north-south and 28 segments per CLK driving east-west per core tile.

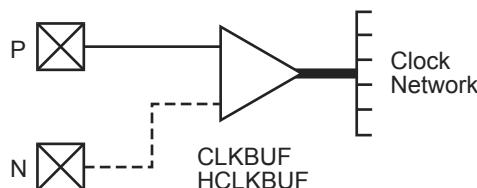

Microsemi's Designer software's place-and-route takes advantage of the segmented clock structure found in Accelerator devices by turning off any unused clock segments. This results in not only better performance but also lower power consumption.

## Global Resource Access Macros

Global resources can be driven by one of three sources: external pad(s), an internal net, or the output of a PLL. These connections can be made by using one of three types of macros: CLKBUF, CLKINT, and PLLCLK.

### **CLKBUF and HCLKBUF**

CLKBUF (HCLKBUF) is used to drive a CLK (HCLK) from external pads. These macros can be used either generically or with the specific I/O standard desired (e.g. CLKBUF\_LVCMOS25, HCLKBUF\_LVDS, etc.) (Figure 2-42).

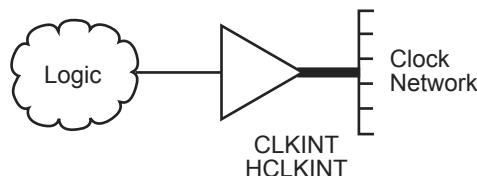

**Figure 2-42 • CLKBUF and HCLKBUF**

Package pins CLKEP and CLKEN are associated with CLKE; package pins HCLKAP and HCLKAN are associated with HCLKA, etc.

Note that when CLKBUF (HCLKBUF) is used with a single-ended I/O standard, it must be tied to the P-pad of the CLK (HCLK) package pin. In this case, the CLK (HCLK) N-pad can be used for user signals.

### **CLKINT and HCLKINT**

CLKINT (HCLKINT) is used to access the CLK (HCLK) resource internally from the user signals (Figure 2-43).

**Figure 2-43 • CLKINT and HCLKINT**

**Table 2-90 • Two RAM Blocks Cascaded**

Worst-Case Commercial Conditions VCCA = 1.425 V, VCCI = 3.0 V, TJ = 70°C

Parameter	Description	-2 Speed		-1 Speed		Std Speed		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
<b>Write Mode</b>
