### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Figure 1-2 • Axcelerator Family Interconnect Elements**

## Logic Modules

Microsemi's Axcelerator family provides two types of logic modules: the register cell (R-cell) and the combinatorial cell (C-cell). The Axcelerator device can implement more than 4,000 combinatorial functions of up to five inputs (Figure 1-3).

**Figure 1-3 • AX C-Cell and R-Cell**

The R-cell contains a flip-flop featuring asynchronous clear, asynchronous preset, and active-low enable control signals (Figure 1-3). The R-cell registers feature programmable clock polarity selectable on a register-by-register basis. This provides additional flexibility (e.g., easy mapping of dual-data-rate functions into the FPGA) while conserving valuable clock resources. The clock source for the R-cell can be chosen from the hardwired clocks, routed clocks, or internal logic.

**Figure 1-7 • I/O Cluster Arrangement**

## Routing

The AX hierarchical routing structure ties the logic modules, the embedded memory blocks, and the I/O modules together (Figure 1-8 on page 1-6). At the lowest level, in and between SuperClusters, there are three local routing structures: FastConnect, DirectConnect, and CarryConnect routing. DirectConnects provide the highest performance routing inside the SuperClusters by connecting a C-cell to the adjacent R-cell. DirectConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

FastConnects provide high-performance, horizontal routing inside the SuperCluster and vertical routing to the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering a maximum routing delay of 0.4 ns.

CarryConnects are used for routing carry logic between adjacent SuperClusters. They connect the FCO output of one two-bit, C-cell carry logic to the FCI input of the two-bit, C-cell carry logic of the SuperCluster below it. CarryConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

The next level contains the core tile routing. Over the SuperClusters within a core tile, both vertical and horizontal tracks run across rows or columns, respectively. At the chip level, vertical and horizontal tracks extend across the full length of the device, both north-to-south and east-to-west. These tracks are composed of highway routing that extend the entire length of the device (segmented at core tile boundaries) as well as segmented routing of varying lengths.

## Calculating Power Dissipation

**Table 2-3 • Standby Current**

| Device | Temperature     | ICCA                   | ICCD A                            | ICCBANK                      |            | ICCP LL                 | ICCCP <sup>1</sup>           |               | IIH, IIL, IOZ <sup>2</sup> | Units |
|--------|-----------------|------------------------|-----------------------------------|------------------------------|------------|-------------------------|------------------------------|---------------|----------------------------|-------|
|        |                 | Standby Current (Core) | Standby Current, Differential I/O | Standby Current per I/O Bank |            | Standby Current per PLL | Standby Current, Charge Pump |               |                            |       |
|        |                 |                        |                                   | 2.5 V VCCI                   | 3.3 V VCCI |                         | Active                       | Bypassed Mode |                            |       |
| AX125  | Typical at 25°C | 1.5                    | 1.5                               | 0.2                          | 0.3        | 0.2                     | 0.3                          | 0.01          | ±0.01                      | mA    |

Notes:

1. ICCCP Active is the ICCDA or the Internal Charge Pump current. ICCCP Bypassed mode is the External Charge Pump current IIH (VPUMP pin).
2. IIH, IIL, or IOZ values are measured with inputs at the same level as VCCI for IIH and GND for IIL and IOZ.

Figure 2-63 illustrates flag generation.

**Figure 2-63 • ALMOST-EMPTY and ALMOST-FULL Logic**

The Verilog codes for the flags are:

```
assign AF = (DIFF[15:0] >={AFVAL[7:0], 8'b00000000})?1:0;
assign AE = ({AEVAL[7:0], 8'b00000000} >=DIFF[15:0])?1:0;
```

The number of DIFF-bits active depends on the configuration depth and width (Table 2-95).

**Table 2-95 • Number of Available Configuration Bits**

| Number of Blocks | Block DxW | Number of AEVAL/AFVAL Bits |
|------------------|-----------|----------------------------|
| 1                | 1x1       | 4                          |
| 2                | 1x2       | 4                          |

| 16               | 8x2       | 7                          |
| 16               | 16x1      | 8                          |

The active-high CLR pin is used to reset the FIFO to the empty state, which sets FULL and AFULL low, and EMPTY and AEMPTY high.

Assuming that the EMPTY flag is not set, new data is read from the FIFO when REN is valid on the active edge of the clock. Write and read transfers are described with timing requirements in "Timing Characteristics" on page 2-100.

## 4 – Datasheet Information

### List of Changes

The following table lists critical changes that were made in the current version of the document.

| Revision                        | Changes                                                                                                                                                                                                                                                                            | Page          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| Revision 18<br>(March 2012)     | Table 2-1 • Absolute Maximum Ratings was updated to correct the maximum DC core supply voltage (VCCA) from 1.6 V to 1.7 V (SAR 36786). The maximum input voltage (VI) was corrected from 3.75 V to 4.1 V (SAR 35419).                                                              | 2-1           |
|                                 | Values for tristate leakage current IOZ, and I <sub>IH</sub> and I <sub>IL</sub> were added to Table 2-3 • Standby Current (SARs 35774, 32021).                                                                                                                                    | 2-2           |
|                                 | Figure 2-2 • VCCPLX and VCOMPLX Power Supply Connect was updated to correct the units for the resistance from "W" to $\Omega$ (SAR 36415).                                                                                                                                         | 2-9           |
|                                 | In the Introduction to the "User I/Os" section, the following sentence was added to clarify the slew rate setting (SAR 34943):<br>The slew rate setting is effective for both rising and falling edges.                                                                            | 2-11          |
|                                 | Figure 2-3 • Use of an External Resistor for 5 V Tolerance was revised to show the VCCI and GND clamp diodes. The explanatory text above the figure was revised as well (SAR 34942).                                                                                               | 2-13          |
|                                 | EQ 3 for 5 V tolerance was corrected to change V <sub>diode</sub> from 0.6 V to 0.7 V (SAR 36786).                                                                                                                                                                                 | 2-13          |
|                                 | Additional information was added to the "Using the Weak Pull-Up and Pull-Down Circuits" section to clarify how the weak pull-up and pull-down resistors are physically implemented (SAR 34945).                                                                                    | 2-17          |
|                                 | The description for the C <sub>INCLK</sub> parameter in Table 2-18 • Input Capacitance was changed from "Input capacitance on clock pin" to "Input capacitance on HCLK and RCLK pin" (SAR 34944).                                                                                  | 2-21          |
|                                 | Table 2-19 • I/O Input Rise Time and Fall Time* is new (SAR 34942).                                                                                                                                                                                                                | 2-21          |
|                                 | The minimum V <sub>IL</sub> for 1.5 V LVCMOS and PCI was corrected from –0.5 to –0.3 in Table 2-29 • DC Input and Output Levels and Table 2-33 • DC Input and Output Levels (SAR 34358).                                                                                           | 2-38, 2-40    |
|                                 | Support for simulating the GCLR/ GPSET feature in the Axcelerator Family was added in Libero software v9.0 SPI1. Reference to the section explaining this in the <i>Antifuse Macro Library Guide</i> was added to the "R-Cell" section (SAR 26413).                                | 2-58          |
| Revision 17<br>(September 2011) | The enable signal in Figure 2-32 • R-Cell Delays was corrected to show it is active low rather than active high (SAR 34946).                                                                                                                                                       | 2-59          |
|                                 | The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "Axcelerator Family Device Status" table indicates the status for each device in the device family.                       | iii           |
|                                 | The "Features" section, "Programmable Interconnect Element" section, and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865). | i, 1-1, 2-108 |
