
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	4224
Number of Logic Elements/Cells	-
Total RAM Bits	55296
Number of I/O	248
Number of Gates	250000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax250-fg484i

R-Cell

Introduction

The R-cell, the sequential logic resource of the Axcelerator devices, is the second logic module type in the AX family architecture. It includes clock inputs for all eight global resources of the Axcelerator architecture as well as global presets and clears (Figure 2-31).

The main features of the R-cell include the following:

- Direct connection to the adjacent logic module through the hardwired connection DCIN. DCIN is driven by the DCOUT of an adjacent C-cell via the Direct-Connect routing resource, providing a connection with less than 0.1 ns of routing delay.
- The R-cell can be used as a standalone flip-flop. It can be driven by any C-cell or I/O modules through the regular routing structure (using DIN as a routable data input). This gives the option of using the R-Cell as a 2:1 MUXed flip-flop as well.
- Provision of data enable-input (S0).
- Independent active-low asynchronous clear (CLR).
- Independent active-low asynchronous preset (PSET). If both CLR and PSET are low, CLR has higher priority.
- Clock can be driven by any of the following (CKP selects clock polarity):
  - One of the four high performance hardwired fast clocks (HCLKs)
  - One of the four routed clocks (CLKs)
  - User signals
- Global power-on clear (GCLR) and preset (GPSET), which drive each flip-flop on a chip-wide basis.
  - When the Global Set Fuse option in the Designer software is unchecked (by default), GCLR = 0 and GPSET = 1 at device power-up. When the option is checked, GCLR = 1 and GPSET = 0. Both pins are pulled High when the device is in user mode. Refer to the "Simulation Support for GCLR/GPSET in Axcelerator" section of the *Antifuse Macro Library Guide* for information on simulation support for GCLR and GPSET.
- S0, S1, PSET, and CLR can be driven by routed clocks CLKE/F/G/H or user signals.
- DIN and S1 can be driven by user signals.

As with the C-cell, the configuration of the R-cell to perform various functions is handled automatically for the user through Microsemi's extensive macro library (see the *Antifuse Macro Library Guide* for a complete listing of available AX macros).

Routing Specifications

Routing Resources

The routing structure found in Axcelerator devices enables any logic module to be connected to any other logic module while retaining high performance. There are multiple paths and routing resources that can be used to route one logic module to another, both within a SuperCluster and elsewhere on the chip.

There are four primary types of routing within the AX architecture: DirectConnect, CarryConnect, FastConnect, and Vertical and Horizontal Routing.

DirectConnect

DirectConnects provide a high-speed connection between an R-cell and its adjacent C-cell (Figure 2-35). This connection can be made from DCOUT of the C-cell to DCIN of the R-cell by configuring of the S1 line of the R-cell. This provides a connection that does not require an antifuse and has a delay of less than 0.1 ns.

Figure 2-35 • **DirectConnect and CarryConnect**

CarryConnect

CarryConnects are used to build carry chains for arithmetic functions (Figure 2-35). The FCO output of the right C-cell of a two-C-cell Cluster drives the FCI input of the left C-cell in the two-C-cell Cluster immediately below it. This pattern continues down both sides of each SuperCluster column.

Similar to the DirectConnects, CarryConnects can be built without an antifuse connection. This connection has a delay of less than 0.1 ns from the FCO of one two-C-cell cluster to the FCI of the two-C-cell cluster immediately below it (see the "Carry-Chain Logic" section on page 2-56 for more information).

FastConnect

For high-speed routing of logic signals, FastConnects can be used to build a short distance connection using a single antifuse (Figure 2-36 on page 2-62). FastConnects provide a maximum delay of 0.3 ns. The outputs of each logic module connect directly to the Output Tracks within a SuperCluster. Signals on the Output Tracks can then be routed through a single antifuse connection to drive the inputs of logic modules either within one SuperCluster or in the SuperCluster immediately below it.

Vertical and Horizontal Routing

Vertical and Horizontal Tracks provide both local and long distance routing (Figure 2-37 on page 2-62). These tracks are composed of both short-distance, segmented routing and across-chip routing tracks (segmented at core tile boundaries). The short-distance, segmented routing resources can be concatenated through antifuse connections to build longer routing tracks.

These short-distance routing tracks can be used within and between SuperClusters or between modules of non-adjacent SuperClusters. They can be connected to the Output Tracks and to any logic module input (R-cell, C-cell, Buffer, and TX module).

The across-chip horizontal and vertical routing provides long-distance routing resources. These resources interface with the rest of the routing structures through the RX and TX modules (Figure 2-37). The RX module is used to drive signals from the across-chip horizontal and vertical routing to the Output Tracks within the SuperCluster. The TX module is used to drive vertical and horizontal across-chip routing from either short-distance horizontal tracks or from Output Tracks. The TX module can also be used to drive signals from vertical across-chip tracks to horizontal across-chip tracks and vice versa.

Figure 2-36 • **FastConnect Routing**

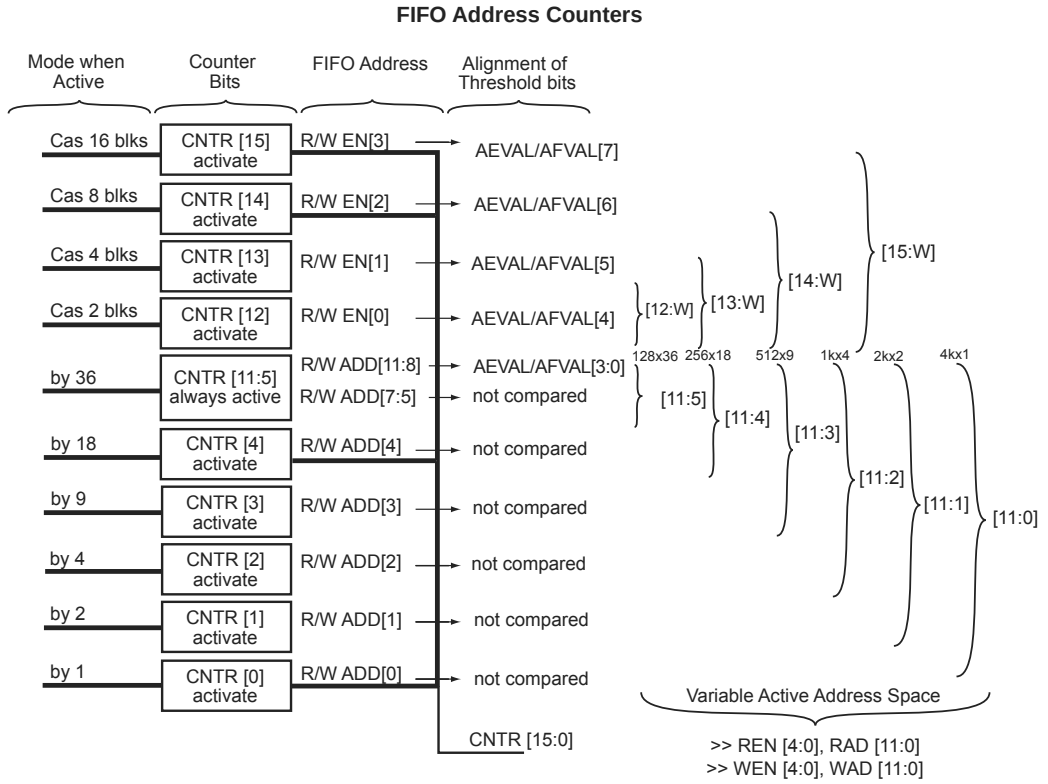
Figure 2-37 • **Horizontal and Vertical Tracks**

FIFO Flag Logic

The FIFO is user configurable into various DEPTHs and WIDTHs. Figure 2-62 shows the FIFO address counter details.

- Bits 11 to 5 are active for all modes.
- As the data word size is reduced, more least-significant bits are added to the address.
- As the number of cascaded blocks increases, the number of significant bits in the address increases.

For example, if four blocks are cascaded as a 1kx16 FIFO with each block having a 1kx4 aspect ratio, bits 11 to 2 of the address will be used to specify locations within each RAM block, whereas bits 13 and 12 will be used to specify the RAM block.



Note: Inactive counter bits are set to zero.

Figure 2-62 • **FIFO Address Counters**

The AFULL and AEMPTY flag threshold values are programmable. The threshold values are AFVAL and AEVAL, respectively. Although the trigger threshold for each flag is defined with eight bits, the effective number of threshold bits in the comparison depends on the configuration. The effective number of threshold bits corresponds to the range of active bits in the FIFO address space (Table 2-94).

Table 2-94 • **FIFO Flag Logic**

Mode	Inactive AEVAL/AFVAL Bits	Inactive DIFF Bits (set to 0)	DIFF Comparison to AFVAL/AEVAL
Non-cascade	[7:4]	[15:12]	DIFF[11:8] withAE/FVAL[3:0]
Cascade 2 blocks	[7:5]	[15:13]	DIFF[12:8] withAE/FVAL[4:0]
Cascade 4 blocks	[7:6]	[15:14]	DIFF[13:8] withAE/FVAL[5:0]
Cascade 8 blocks	[7]	[15]	DIFF[14:8] withAE/FVAL[6:0]
Cascade 16 blocks	None	None	DIFF[15:8] withAE/FVAL[7:0]

Revision	Changes	Page
Revision 17 (continued)	The C180 package was removed from product tables and the "Package Pin Assignments" section (PDN 0909).	3-1
	Package names used in the"Axcelerator Family Product Profile" and "Package Pin Assignments" section were revised to match standards given in *Package Mechanical Drawings* (SAR 27395).	i, 3-1
	The "Introduction" section for "User I/Os" was updated as follows: "The user does not need to assign VREF pins for OUTBUF and TRIBUF. VREF pins are needed only for input and bidirectional I/Os" (SARs 24181, 24309).	2-11
	Power values in Table 2-4 • Default CLOAD/VCCI were updated to reflect those of SmartPower (SAR 33945).	2-3
	Two parameter names were corrected in Figure 2-10 • Output Buffer Delays. One occurrence of t_{ENLZ} was changed to t_{ENZL} and one occurrence of t_{ENHZ} was changed to t_{ENZH} (SAR 33890).	2-22
	The "Timing Model" section was updated with new timing values. Timing tables in the "I/O Specifications" section were updated to include enable paths. Values in the timing tables in the "Voltage-Referenced I/O Standards" section and "Differential Standards" section were updated. Table 2-63 • R-Cell was updated (SAR 33945).	2-8, 2-26 to 2-53
	Figure 2-11 • Timing Model was replaced (SAR 33043).	2-23
	The timing tables for "RAM" and "FIFO" were updated (SAR 33945).	2-90 to 2-106
	"Data Registers (DRs)" values were modified for IDCODE and USERCODE (SARs 18257, 26406).	2-108
	The package diagram for the "CQ208" package was incorrect and has been replaced with the correct diagram (SARs 23865, 26345).	3-89
Revision 16 (v2.8, Oct. 2009)	The datasheet was updated to include AX2000-CQ2526 information.	N/A
	MIL-STD-883 Class B is no longer supported by Axcelerator FPGAs and as a result was removed.	N/A
	A footnote was added to the "Introduction" in the "Axcelerator Clock Management System" section.	2-75
Revision 15 (v2.7, Nov. 2008)	RoHS-compliant information was added to the "Ordering Information".	ii
	ACTgen was changed to SmartGen because ACTgen is obsolete.	N/A
Revision 14 (v2.6)	In Table 2-4, the units for the P_{LOAD}, P_{10}, and $P_{I/O}$ were updated from mW/MHz to mW/MHz.	2-3
	In the "Pin Descriptions"section, the HCLK and CLK descriptions were updated to include tie-off information.	2-9
	The "Global Resource Distribution" section was updated.	2-70
	The " CG624" table was updated.	3-116
Revision 13 (v2.5)	A note was added to Table 2-2.	2-1
	In the "Package Thermal Characteristics", the temperature was changed from 150°C to 125°C.	2-6
