

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	8064
Number of Logic Elements/Cells	-
Total RAM Bits	73728
Number of I/O	317
Number of Gates	500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax500-1fgg484

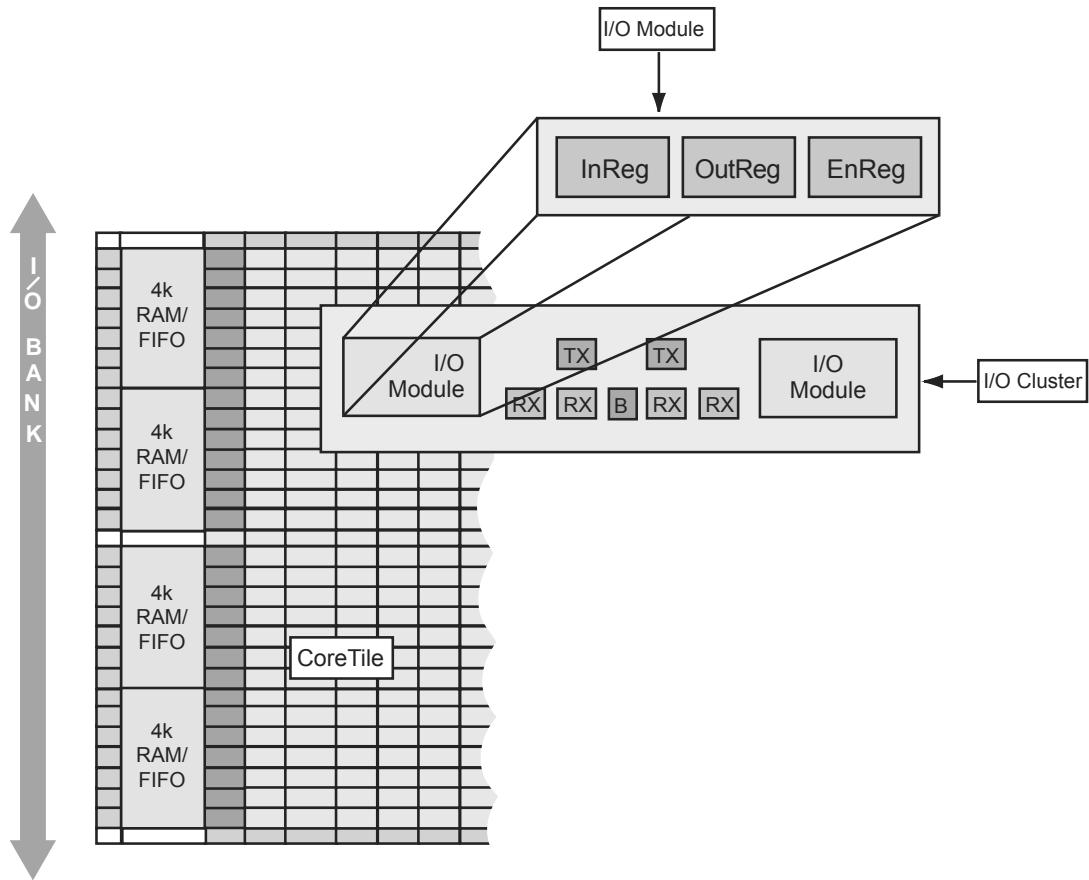

Figure 1-7 • I/O Cluster Arrangement

Routing

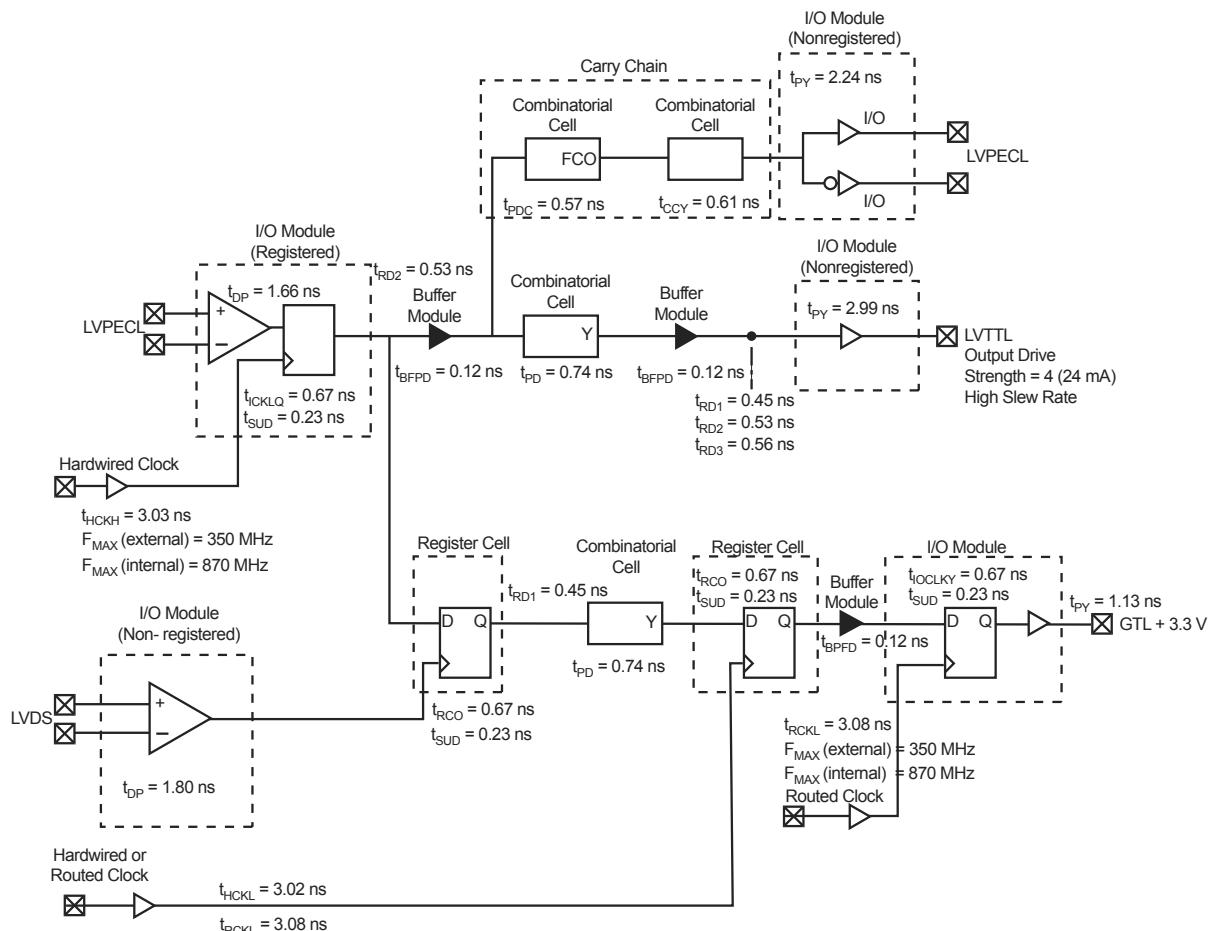

The AX hierarchical routing structure ties the logic modules, the embedded memory blocks, and the I/O modules together (Figure 1-8 on page 1-6). At the lowest level, in and between SuperClusters, there are three local routing structures: FastConnect, DirectConnect, and CarryConnect routing. DirectConnects provide the highest performance routing inside the SuperClusters by connecting a C-cell to the adjacent R-cell. DirectConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

FastConnects provide high-performance, horizontal routing inside the SuperCluster and vertical routing to the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering a maximum routing delay of 0.4 ns.

CarryConnects are used for routing carry logic between adjacent SuperClusters. They connect the FCO output of one two-bit, C-cell carry logic to the FCI input of the two-bit, C-cell carry logic of the SuperCluster below it. CarryConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

The next level contains the core tile routing. Over the SuperClusters within a core tile, both vertical and horizontal tracks run across rows or columns, respectively. At the chip level, vertical and horizontal tracks extend across the full length of the device, both north-to-south and east-to-west. These tracks are composed of highway routing that extend the entire length of the device (segmented at core tile boundaries) as well as segmented routing of varying lengths.

Timing Model

Note: Worst case timing data for the AX1000, -2 speed grade

Figure 2-1 • Worst Case Timing Data

Hardwired Clock – Using LVTTL 24 mA High Slew Clock I/O

External Setup

$$\begin{aligned} &= (t_{DP} + t_{RD2} + t_{SUD}) - t_{HCKL} \\ &= (1.72 + 0.53 + 0.23) - 3.02 = -0.54\text{ ns} \end{aligned}$$

Clock-to-Out (Pad-to-Pad)

$$\begin{aligned} &= t_{HCKL} + t_{RCO} + t_{RD1} + t_{PY} \\ &= 3.02 + 0.67 + 0.45 + 2.99 = 7.13\text{ ns} \end{aligned}$$

Routed Clock – Using LVTTL 24 mA High Slew Clock I/O

External Setup

$$\begin{aligned} &= (t_{DP} + t_{RD2} + t_{SUD}) - t_{RCKH} \\ &= (1.72 + 0.53 + 0.23) - 3.13 = -0.65\text{ ns} \end{aligned}$$

Clock-to-Out (Pad-to-Pad)

$$\begin{aligned} &= t_{RCKH} + t_{RCO} + t_{RD1} + t_{PY} \\ &= 3.13 + 0.67 + 0.45 + 3.03 = 7.24\text{ ns} \end{aligned}$$

User I/Os²

Introduction

The Axcelerator family features a flexible I/O structure, supporting a range of mixed voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V) with its bank-selectable I/Os. Table 2-8 on page 2-12 contains the I/O standards supported by the Axcelerator family, and Table 2-10 on page 2-12 compares the features of the different I/O standards.

Each I/O provides programmable slew rates, drive strengths, and weak pull-up and weak pull-down circuits. The slew rate setting is effective for both rising and falling edges.

I/O standards, except 3.3 V PCI and 3.3 V PCI-X, are capable of hot insertion. 3.3 V PCI and 3.3 V PCI-X are 5 V tolerant with the aid of an external resistor.

The input buffer has an optional user-configurable delay element. The element can reduce or eliminate the hold time requirement for input signals registered within the I/O cell. The value for the delay is set on a bank-wide basis. Note that the delay WILL be a function of process variations as well as temperature and voltage changes.

Each I/O includes three registers: an input (InReg), an output (OutReg), and an enable register (EnReg). I/Os are organized into banks, and there are eight banks per device—two per side (Figure 2-6 on page 2-18). Each I/O bank has a common VCCI, the supply voltage for its I/Os.

For voltage-referenced I/Os, each bank also has a common reference-voltage bus, VREF. While VREF must have a common voltage for an entire I/O bank, its location is user-selectable. In other words, any user I/O in the bank can be selected to be a VREF.

The location of the VREF pin should be selected according to the following rules:

- Any pin that is assigned as a VREF can control a maximum of eight user I/O pad locations in each direction (16 total maximum) within the same I/O bank.
- I/O pad locations listed as no connects are counted as part of the 16 maximum. In many cases, this leads to fewer than eight user I/O package pins in each direction being controlled by a VREF pin.
- Dedicated I/O pins such as GND and VCCI are counted as part of the 16.
- The two user I/O pads immediately adjacent on each side of the VREF pin (four in total) may only be used as inputs. The exception is when there is a VCCI/GND pair separating the VREF pin and the user I/O pad location.
- The user does not need to assign VREF pins for OUTBUF and TRIBUF. VREF pins are needed only for input and bidirectional I/Os.

The differential amplifier supply voltage VCCDA should be connected to 3.3 V.

A user can gain access to the various I/O standards in three ways:

- Instantiate specific library macros that represent the desired specific standard.
- Use generic I/O macros and then use Designer's PinEditor to specify the desired I/O standards (please note that this is not applicable to differential standards).
- A combination of the first two methods.

Refer to the *I/O Features in Axcelerator Family Devices* application note and the *Antifuse Macro Library Guide* for more details.

2. Do not use an external resistor to pull the I/O above V_{CCI} for a higher logic "1" voltage level. The desired higher logic "1" voltage level will be degraded due to a small I/O current, which exists when the I/O is pulled up above V_{CCI} .

HSTL Class I

High-Speed Transceiver Logic is a general-purpose high-speed 1.5 V bus standard (EIA/JESD8-6). The Axcelerator devices support Class I. This requires a differential amplifier input buffer and a push-pull output buffer.

Table 2-41 • DC Input and Output Levels

VIL		VIH		VOL	VOH	IOL	IOH
